

# *Effects of different XBT corrections on historic and recent ocean heat content calculations*

Tim Boyer

U. S. National Oceanographic Data  
Center, Silver Spring, Maryland

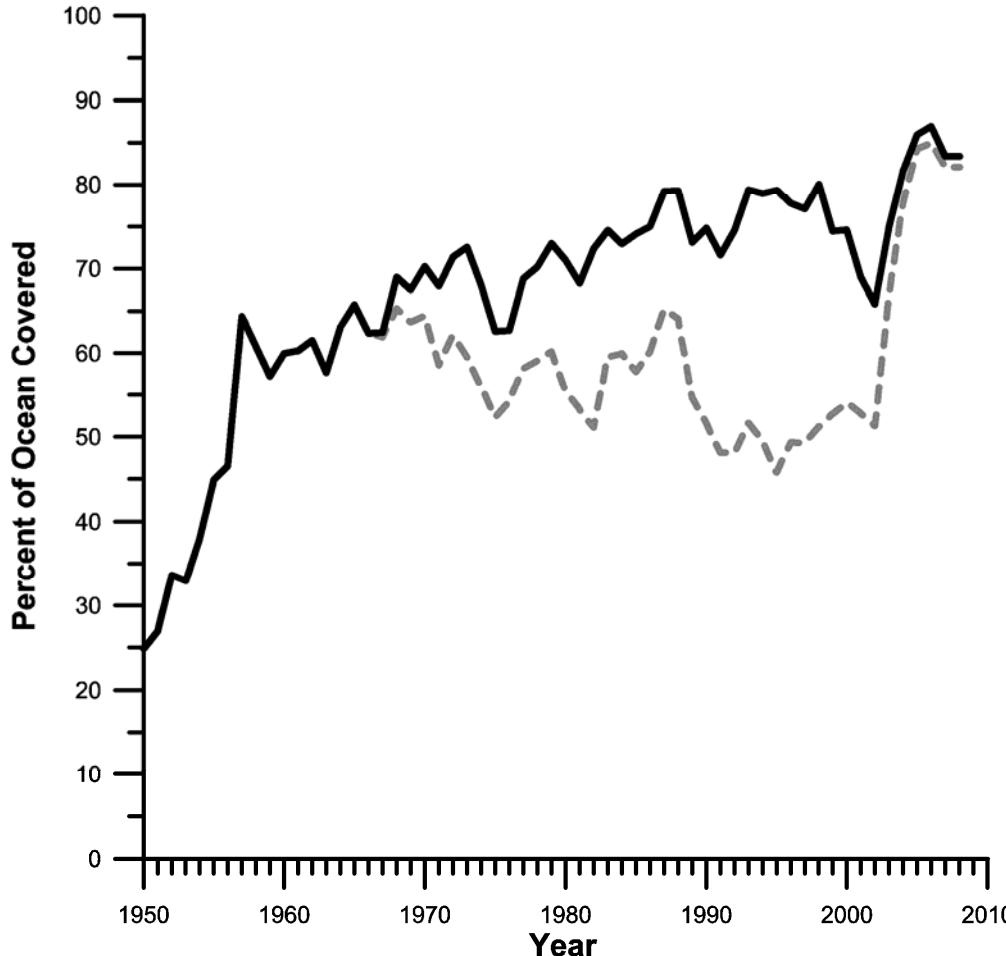

August, 2010

## Our Antagonist

The **XBT** with its time-varying,  
depth-varying, temperature-varying  
drop-rate, variable equipment,  
variable manufacture, variable  
deployment technique and  
conditions, temperature bias, and  
lack of meta-data.

# Main Questions

- Do we need XBTs for ocean heat content integrals (historical and in the future)?
- How similar are different corrections with respect to ocean heat content integrals?
- How do we measure how good are the corrections?
- Should we (oceanographers) settle on one method for XBT correction, and if so, how do we disseminate correction information/data?

Percent of  $1^{\circ}$  ocean squares globally with adequate coverage using all instrument types (solid line) and using all instrument types except XBTs (dashed line). A  $1^{\circ}$ -square is considered to have adequate coverage if there are at least 3  $1^{\circ}$ -squares with at least 1 temperature profile within a 440 km radius of the center of the  $1^{\circ}$ -square. Criteria is as used for climatologies in Levitus *et al.* (2009).

# Into the Future

**Number of temperature profiles in the World Ocean Database (WOD) by instrument: 2009**

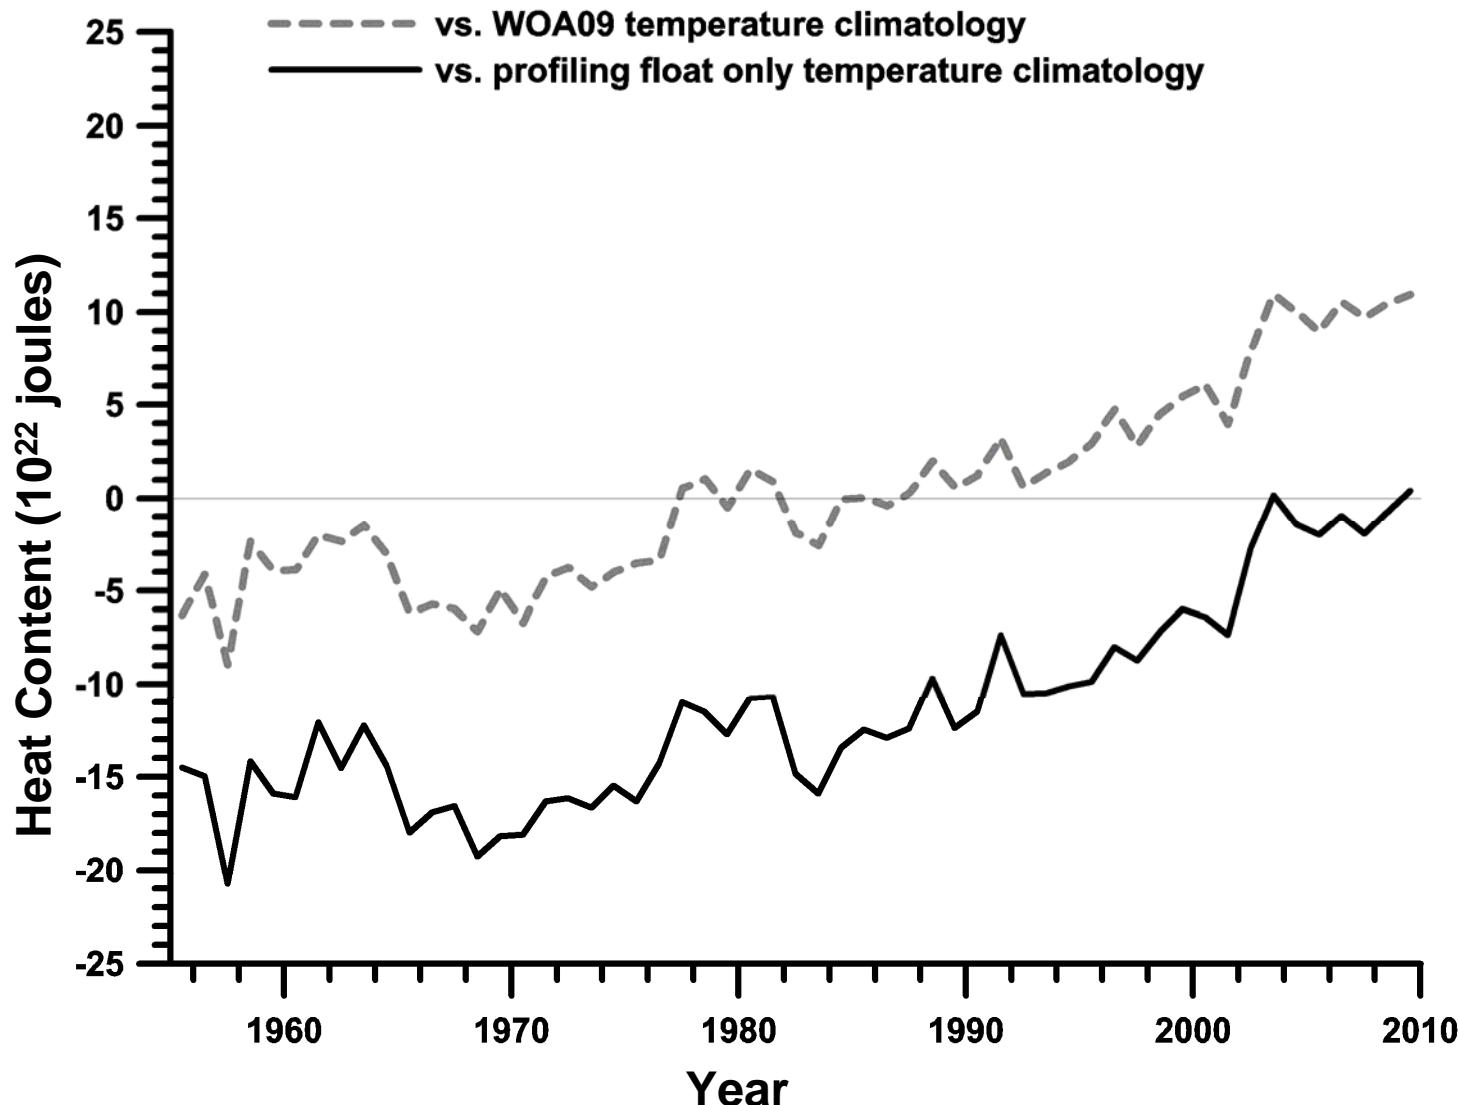

- profiling floats            118,988
  - XBT                        20,173
  - ship-based CTD            13,504
- 

- tropical moored buoys 32,222
- elephant seal            41,069
- glider                    877

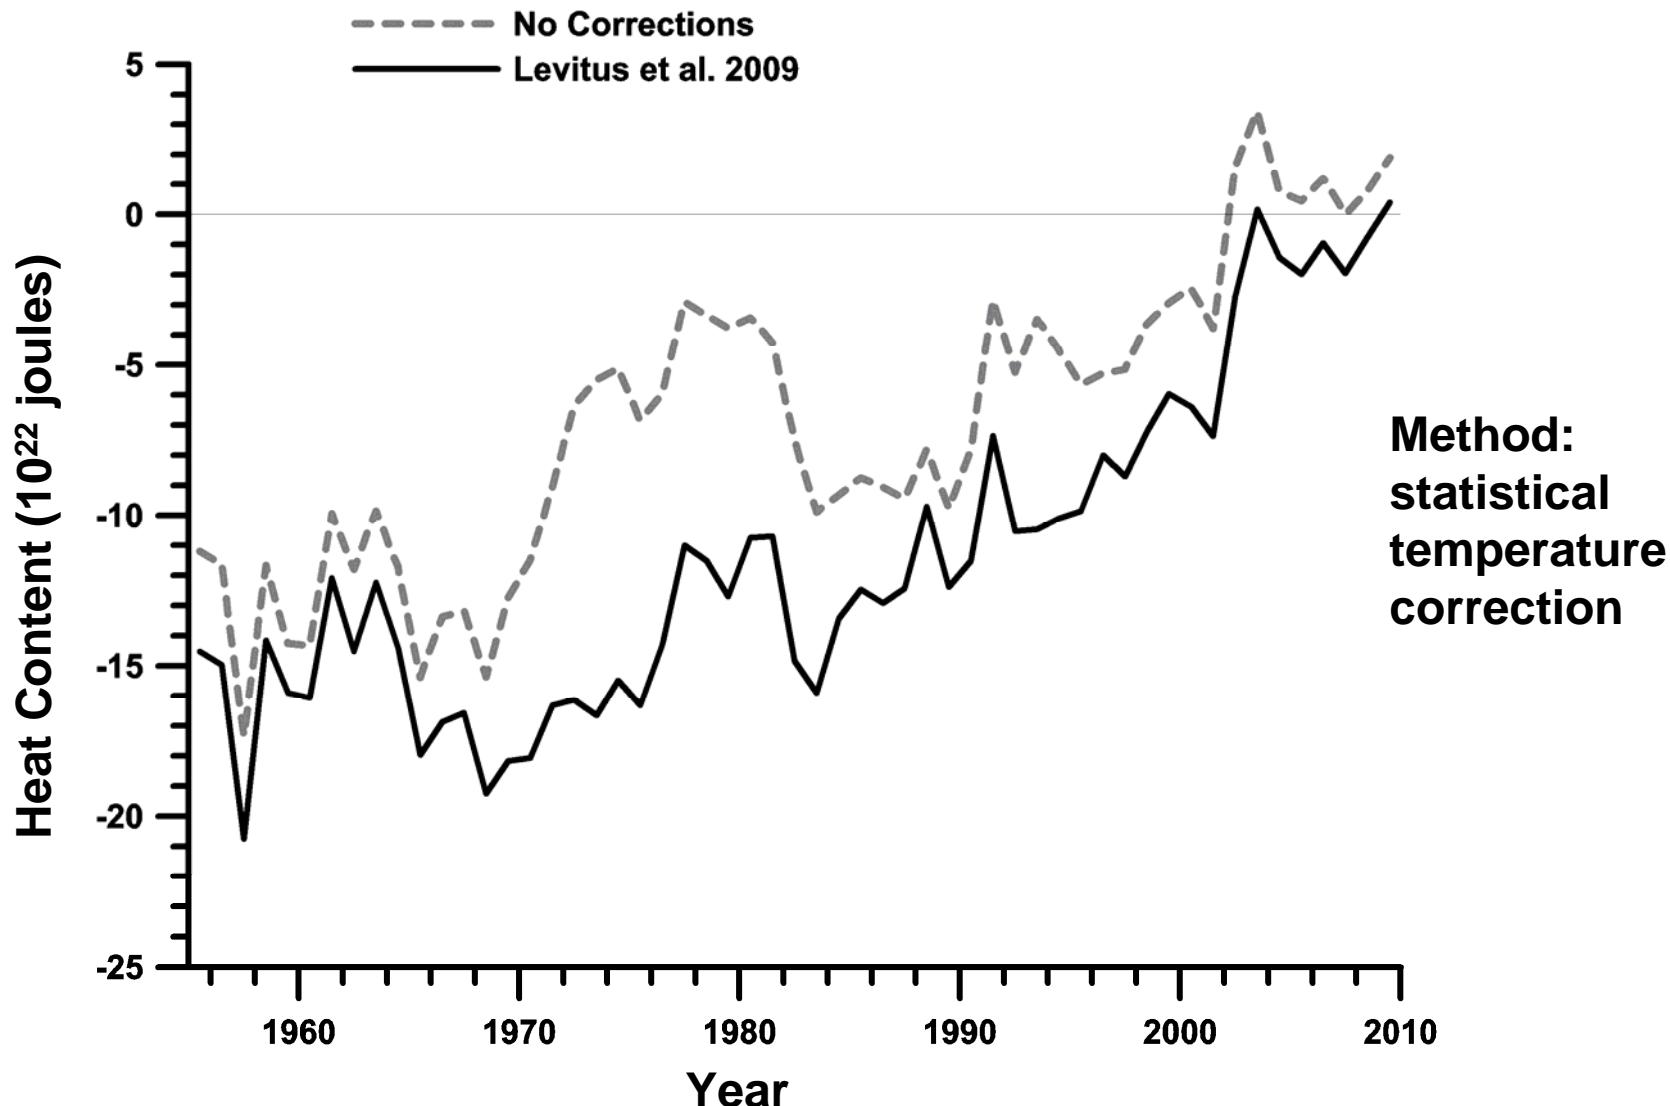

**XBTs were ~9% of all global coverage, widely extant instruments  
XBTs were ~6% of all temperature profiles.**

# Comparison of XBT Correction Methods

- Use same data set (WOD) , same quality control
- Apply XBT corrections, calculate ocean heat content anomaly integrals using same method.
- Use same base mean ocean temperature field. In this case, a profiling float only climatology.
- Compare heat content integrals: How similar are results from different methods?

Integrated Ocean Heat Content Anomaly 0-700 m  
depth profiling float only climatology used for the  
present experiment.

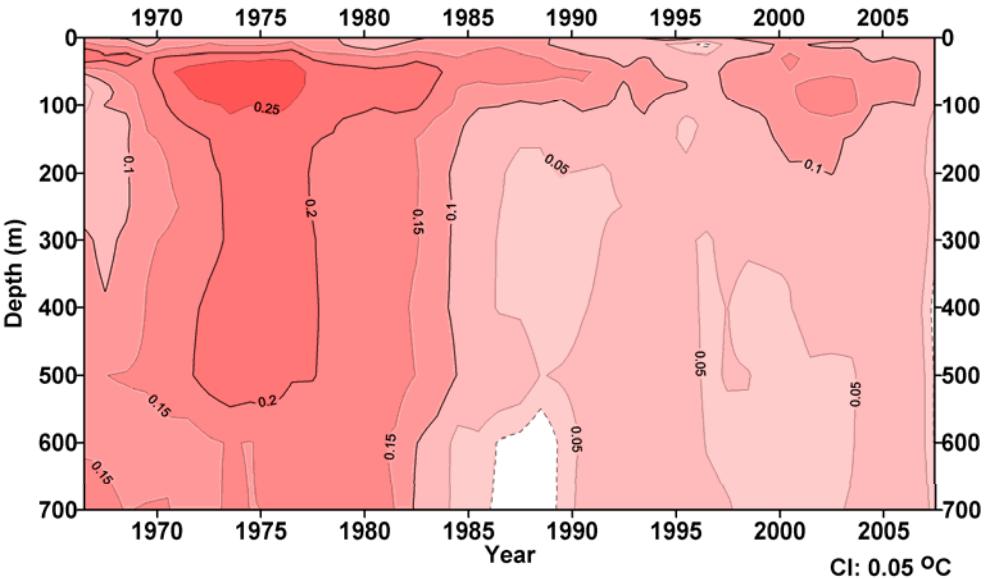

**Method:**  
statistical  
temperature  
correction

Integrated Ocean Heat Content Anomaly 0-700 m  
Levitus et al. 2009 corrections.

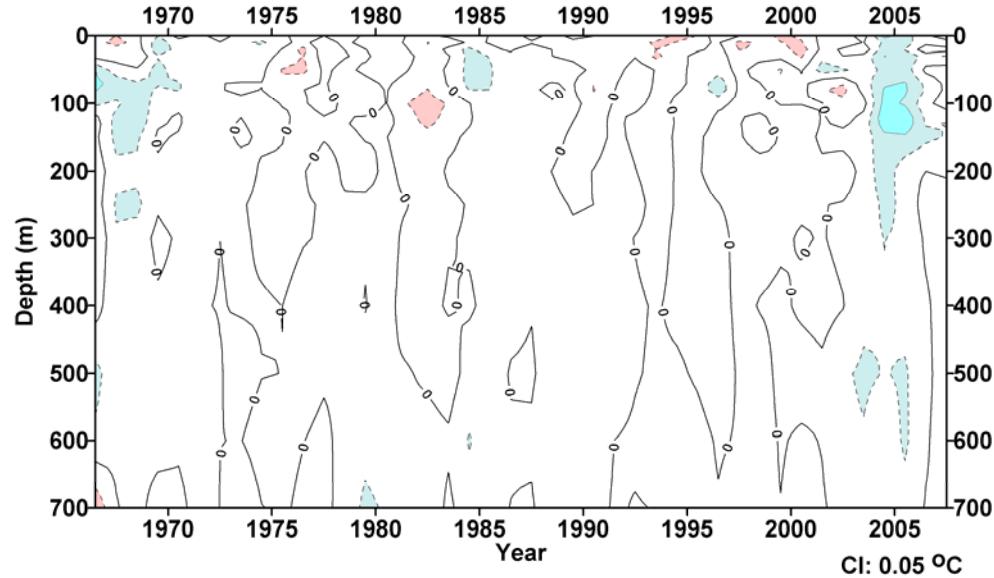

# Performance Metric

- Compare XBT vs. CTD/bottle temperature anomaly means at standard depths,  $4^{\circ} \times 2^{\circ}$  lat/lon boxes, 5-year running means (similar to Gouretski and Koltermann, 2007).
- Relatively easy to compute, understand.
- Limited metric: Only works in time periods, areas where there are sufficient data (what is sufficient data?).
- Can also compare temperature bins, latitude bins (see Gouretski and Reseghetti).

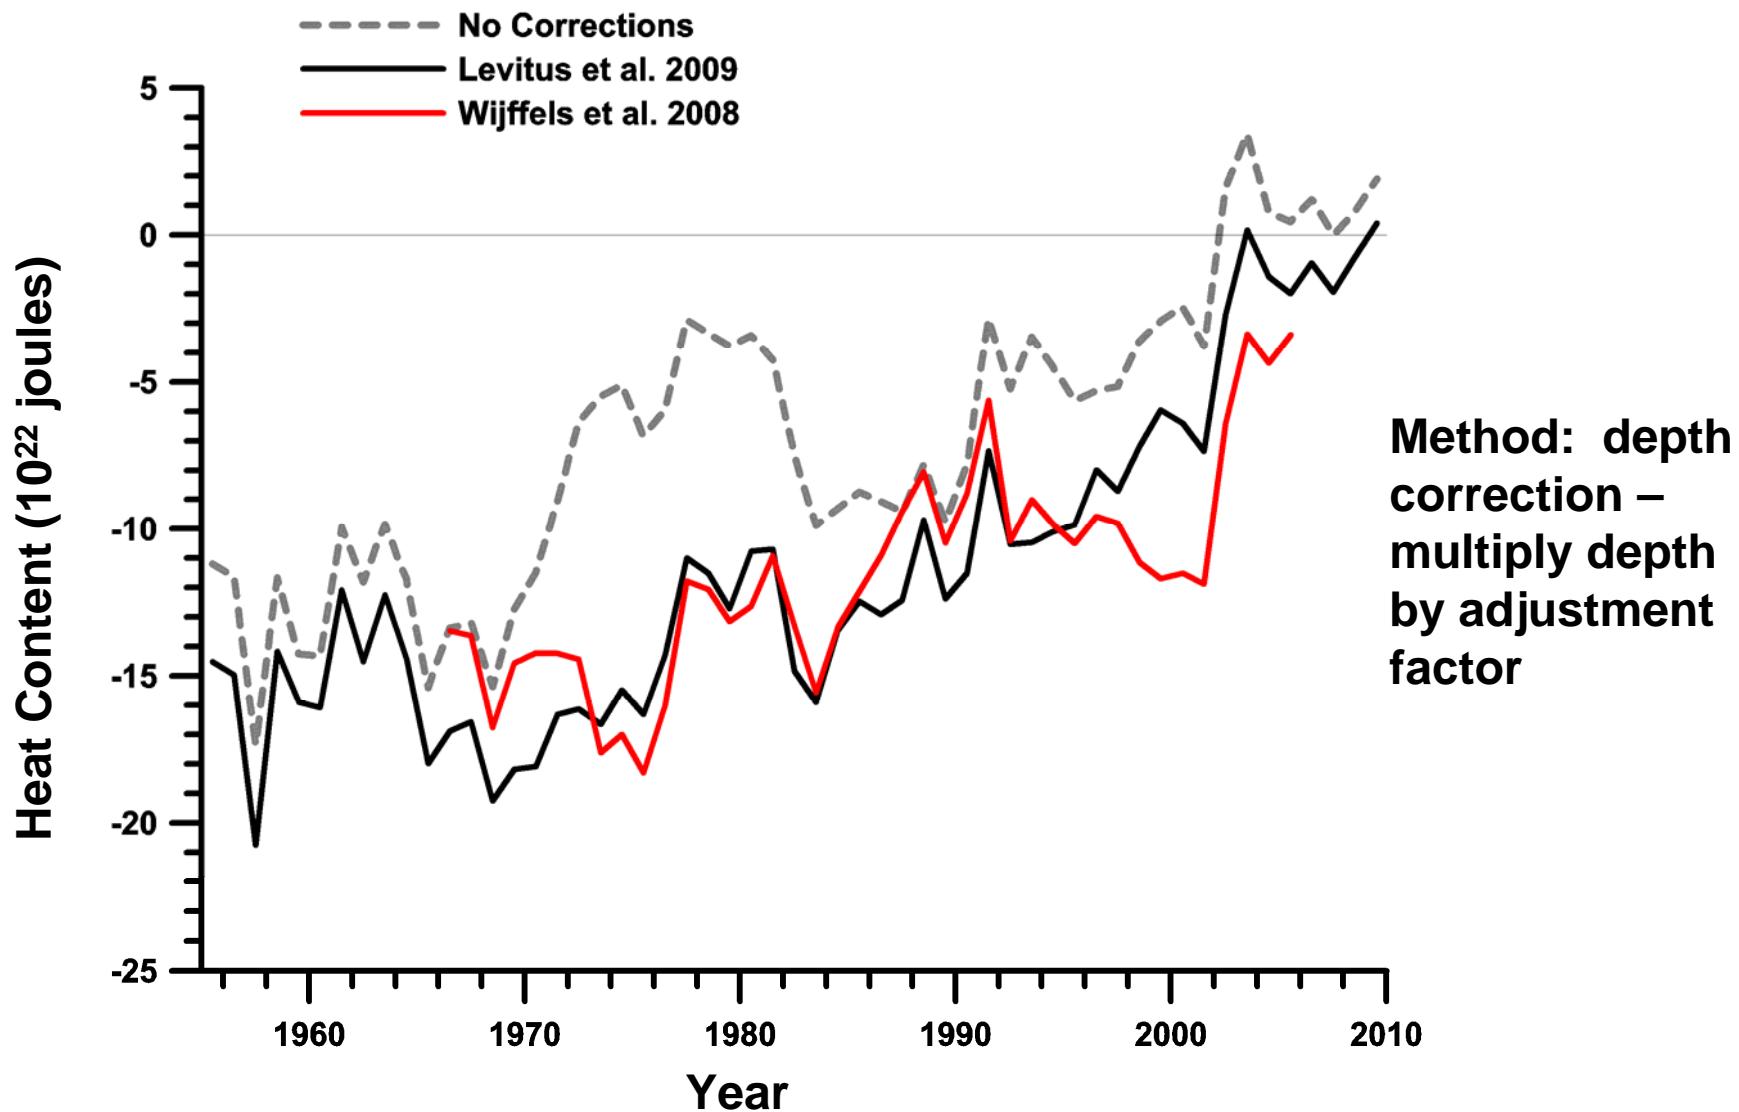

# XBT minus CTD temperature means Red=positive, Blue=Negative

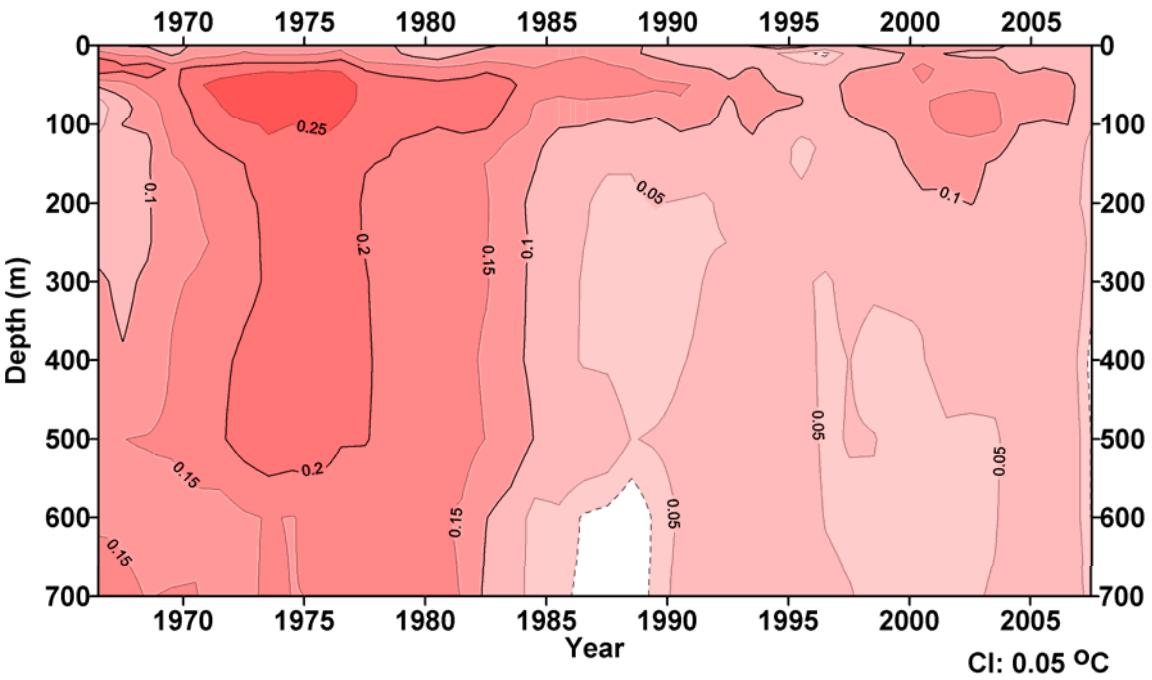

Initial XBT bias vs. CTD/Bottle  
warm everywhere, time/depth  
variant. This is how variable  
bias was first identified  
(Gouretski and Koltermann,  
2007)

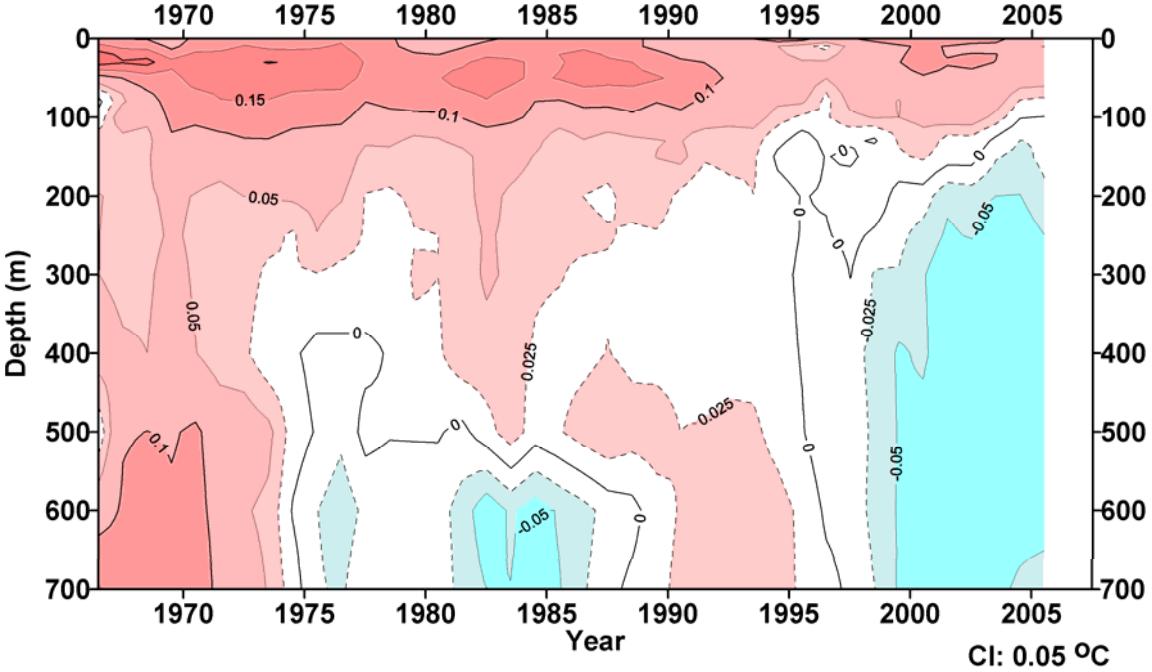

Levitus et al., 2009  
simply subtracts bias  
from each standard level.  
Since comparison is run  
on subset of XBT, no  
guarantee it will work  
globally.

Integrated Ocean Heat Content Anomaly 0-700 m  
Wijffels et al. 2009 corrections

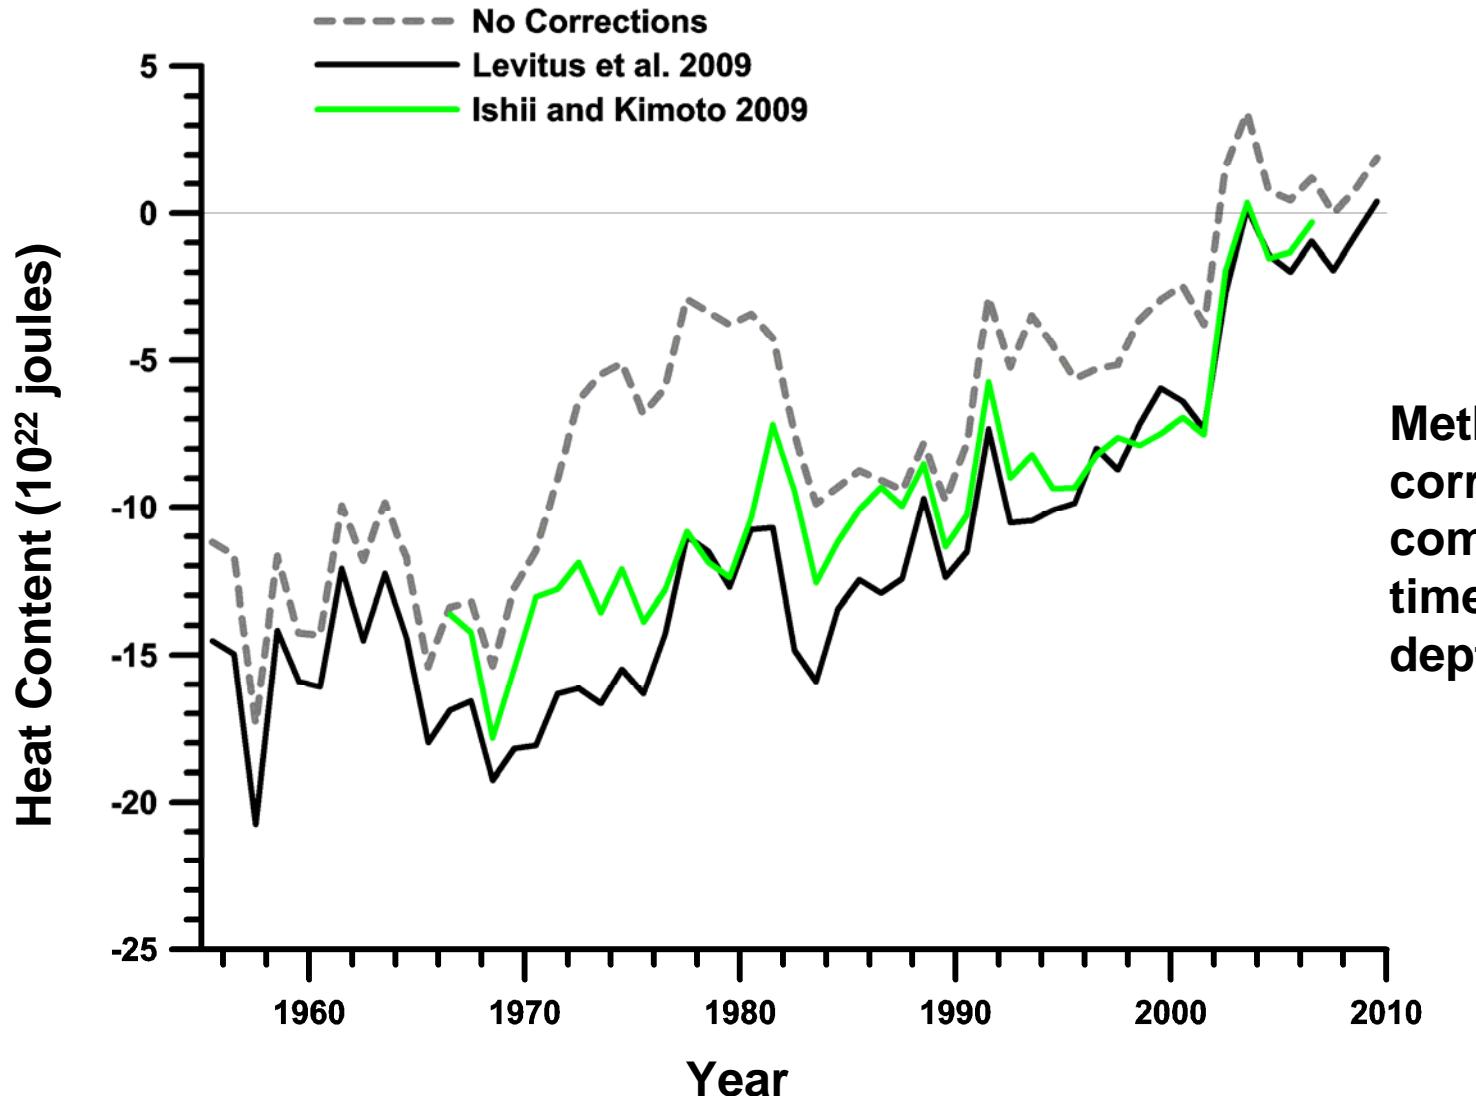

XBT minus CTD  
temperature means  
**No XBT Corrections**

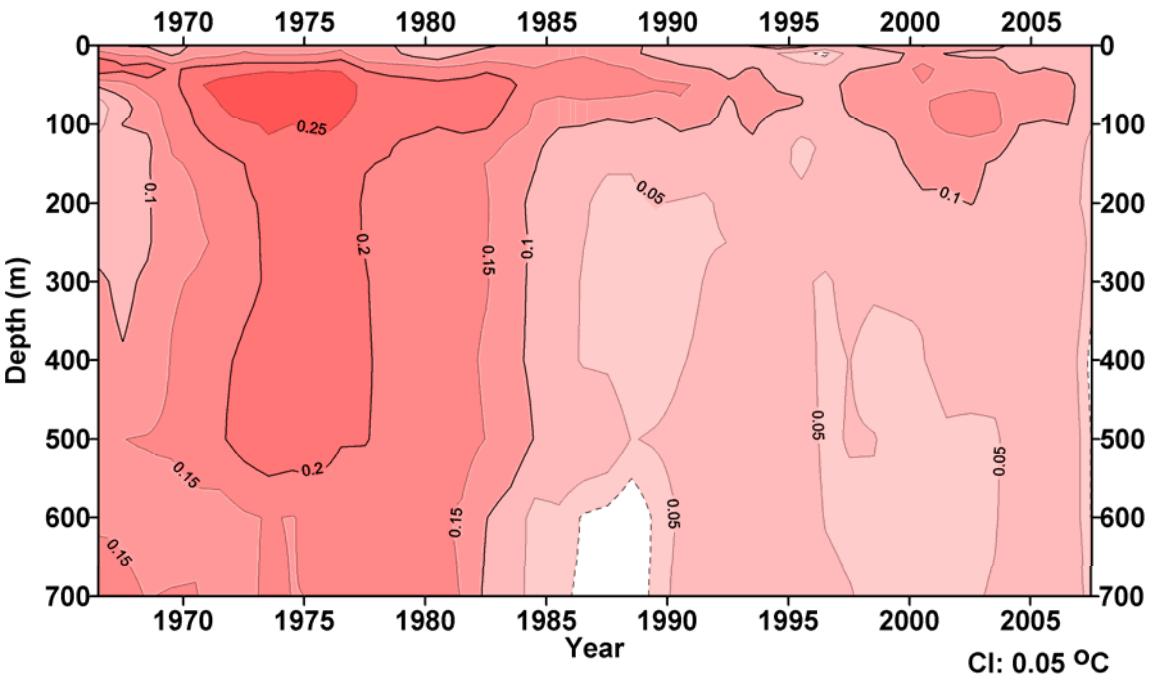

XBT minus CTD  
temperature means  
**Wijffels et al. 2008  
corrections applied**

**Red=positive, Blue=Negative**

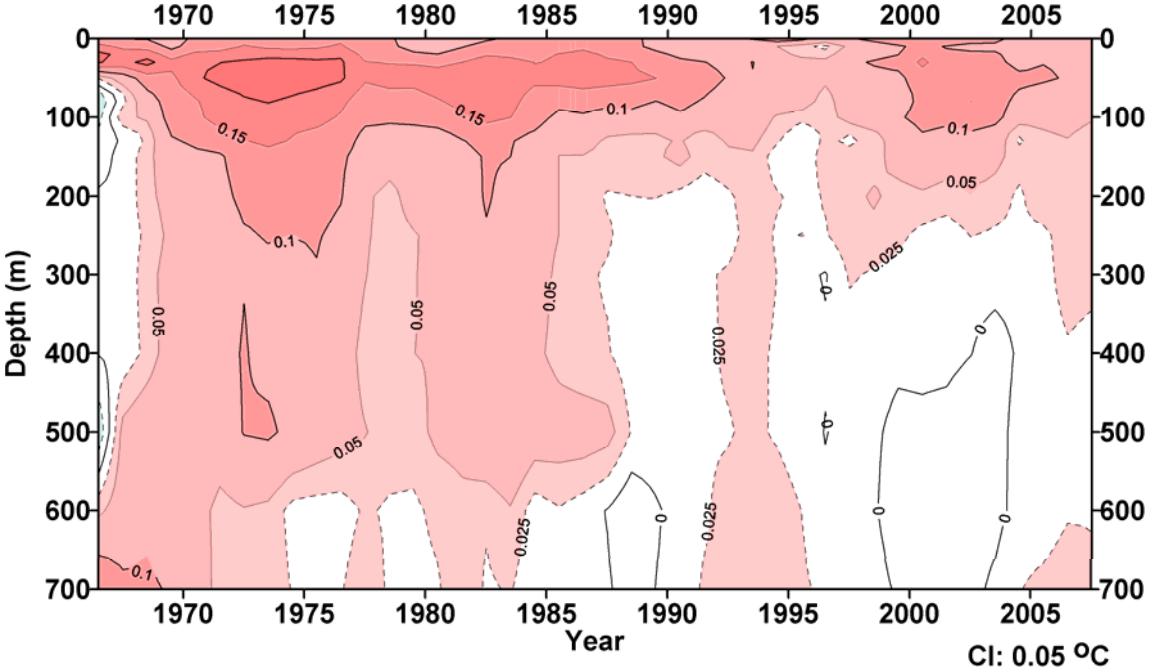

**Method:** depth correction - compute elapsed time, then adjust depth

Integrated Ocean Heat Content Anomaly 0-700 m  
Ishii and Kimoto, 2009 corrections

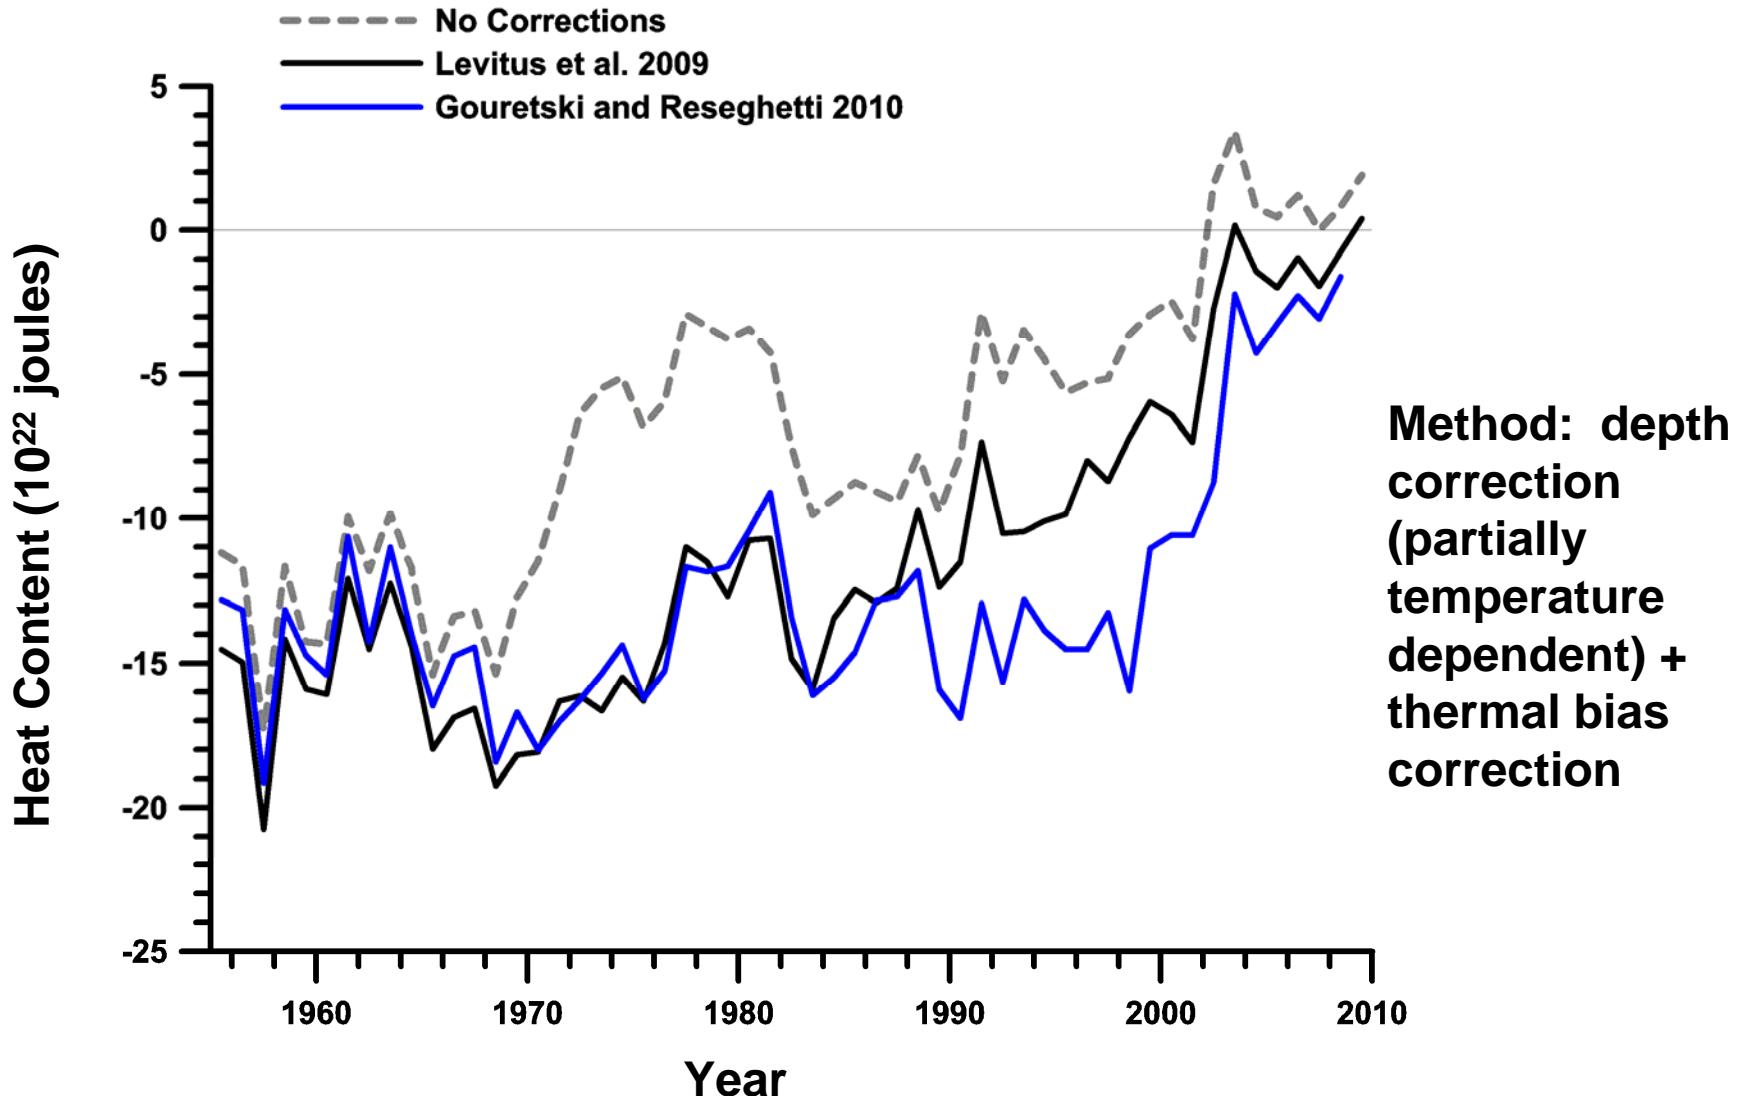

**XBT minus CTD  
temperature means  
No XBT Corrections**

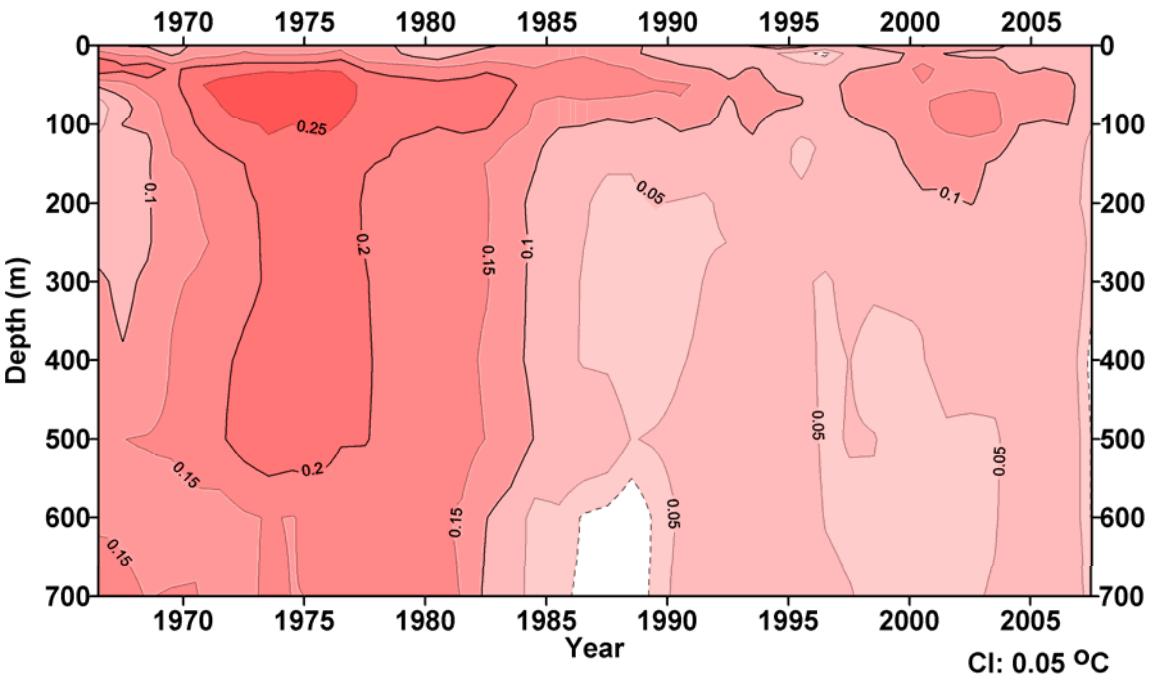

**XBT minus CTD  
temperature means**

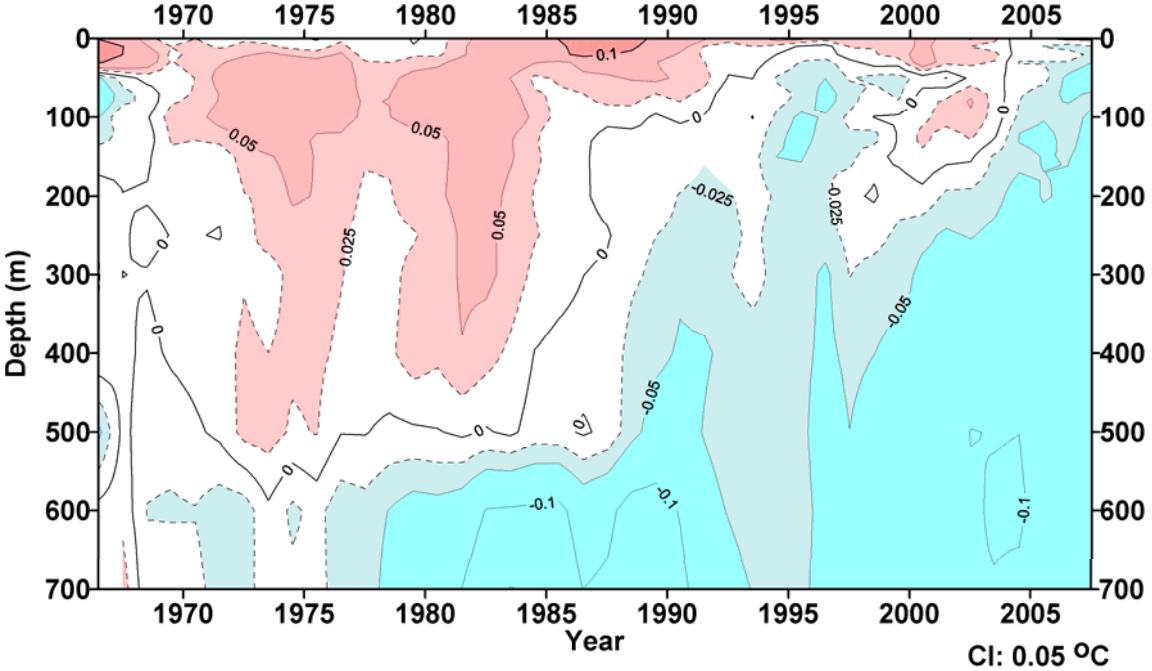

**Red=positive, Blue=Negative**

Integrated Ocean Heat Content Anomaly 0-700 m  
Gouretski and Reseghetti, 2010 corrections

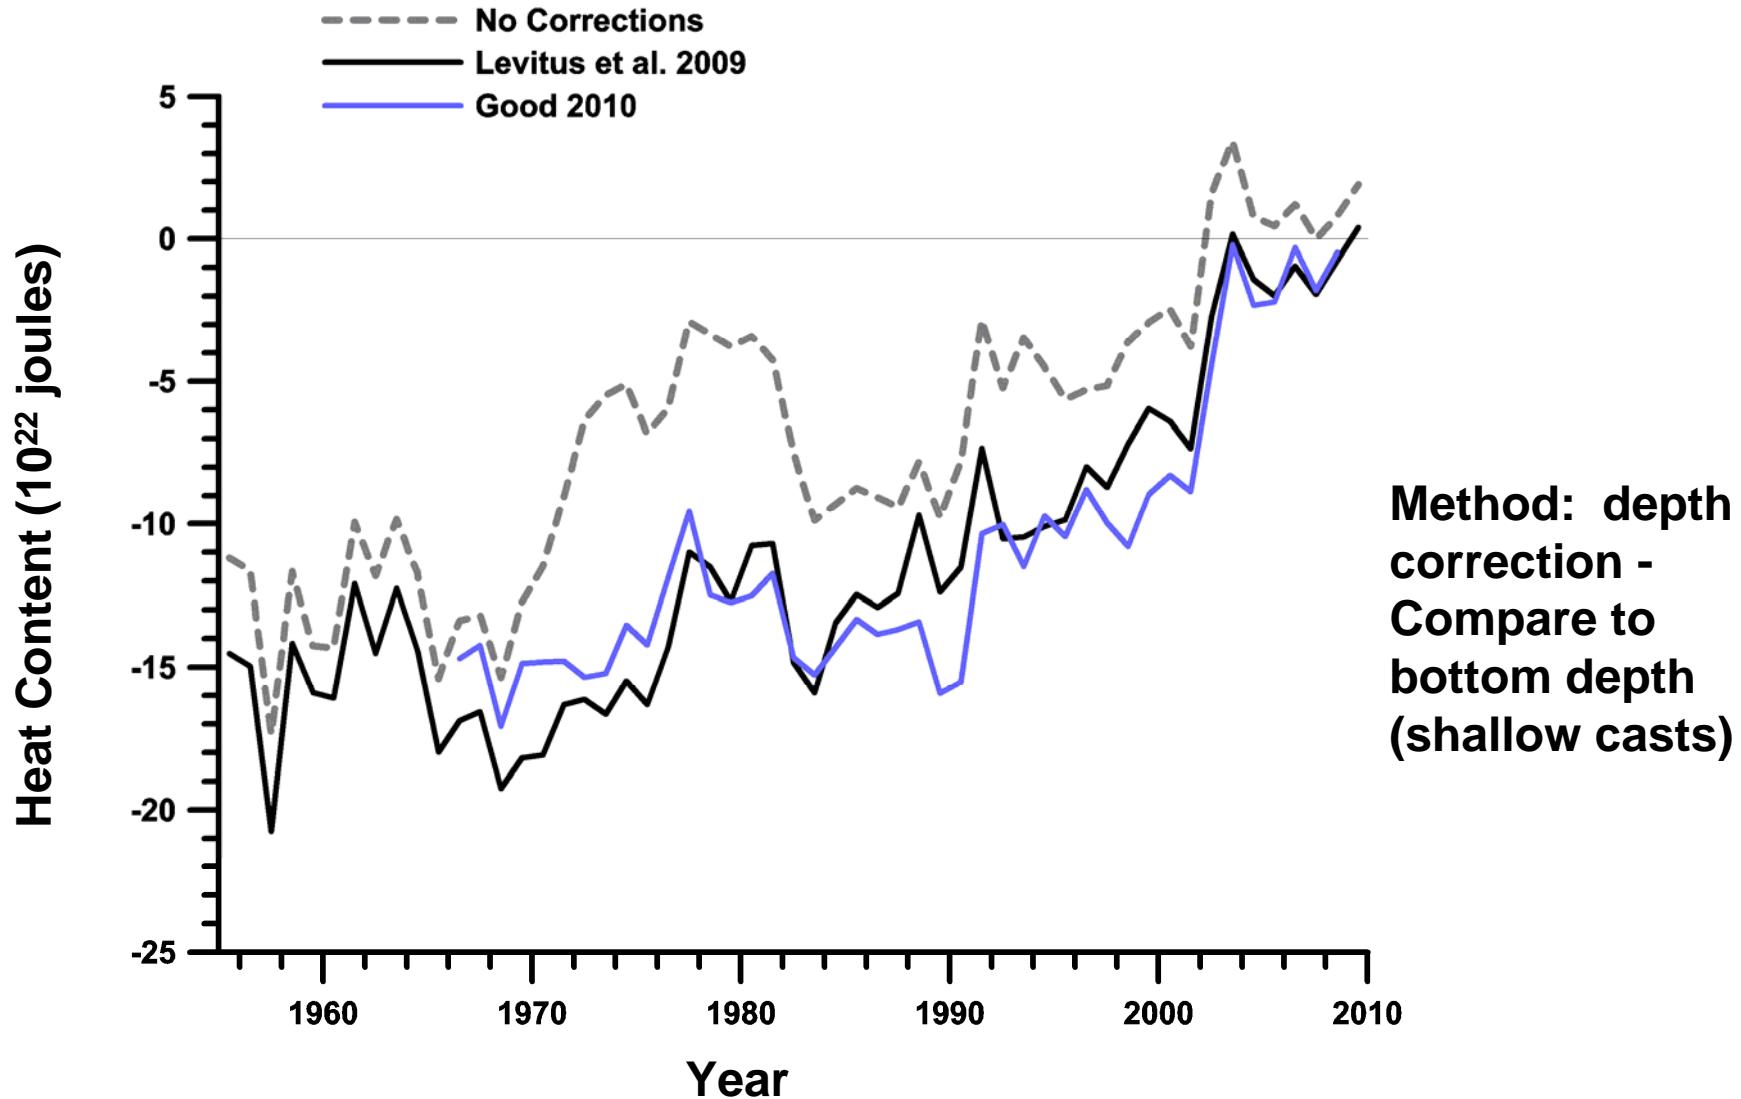

XBT minus CTD  
temperature means  
**No XBT Corrections**

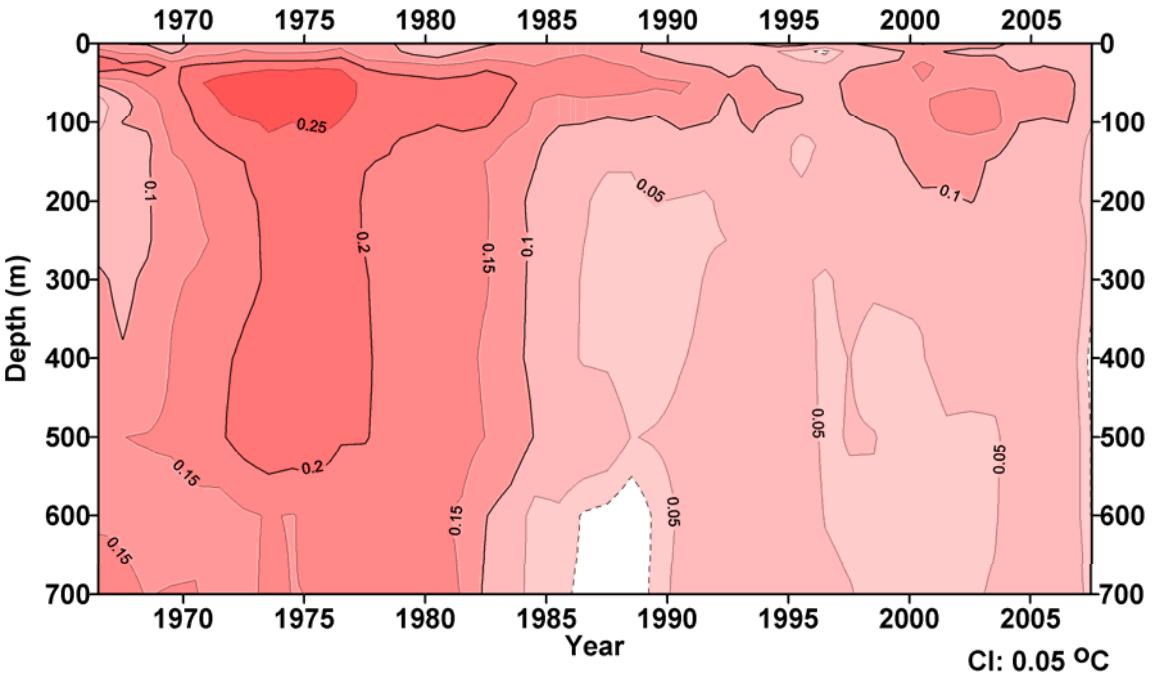

XBT minus CTD  
temperature means  
**Gouretski and  
Reseghetti, 2010  
corrections applied**

**Red=positive, Blue=Negative**

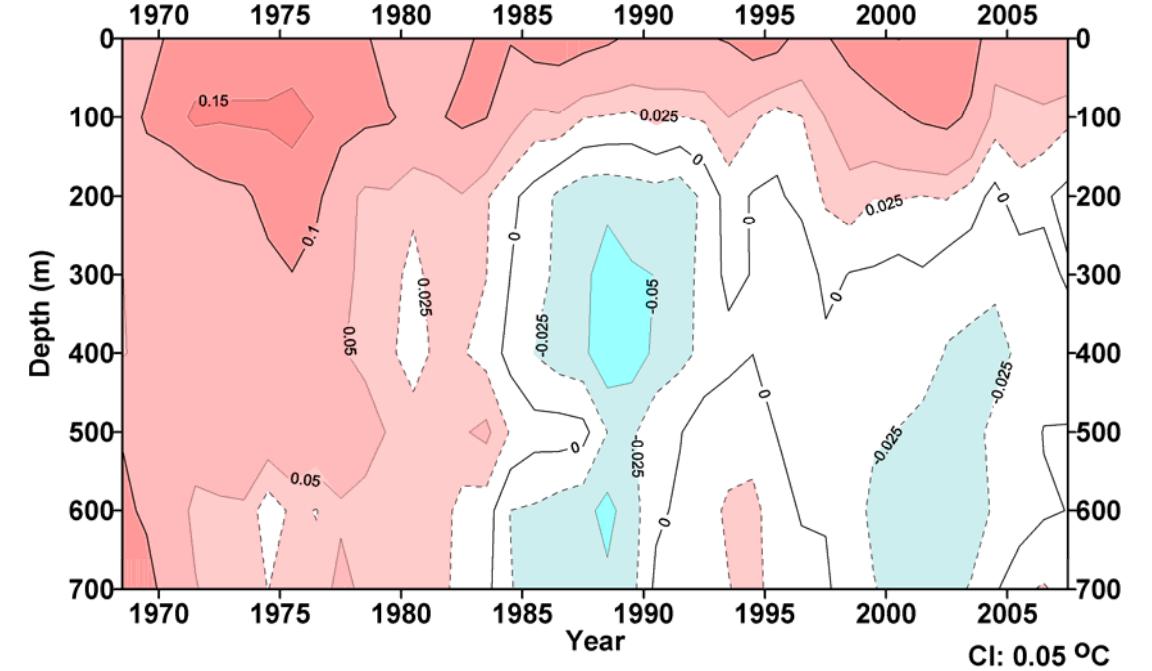

Integrated Ocean Heat Content Anomaly 0-700 m  
Good, 2010 corrections

**XBT minus CTD  
temperature means**

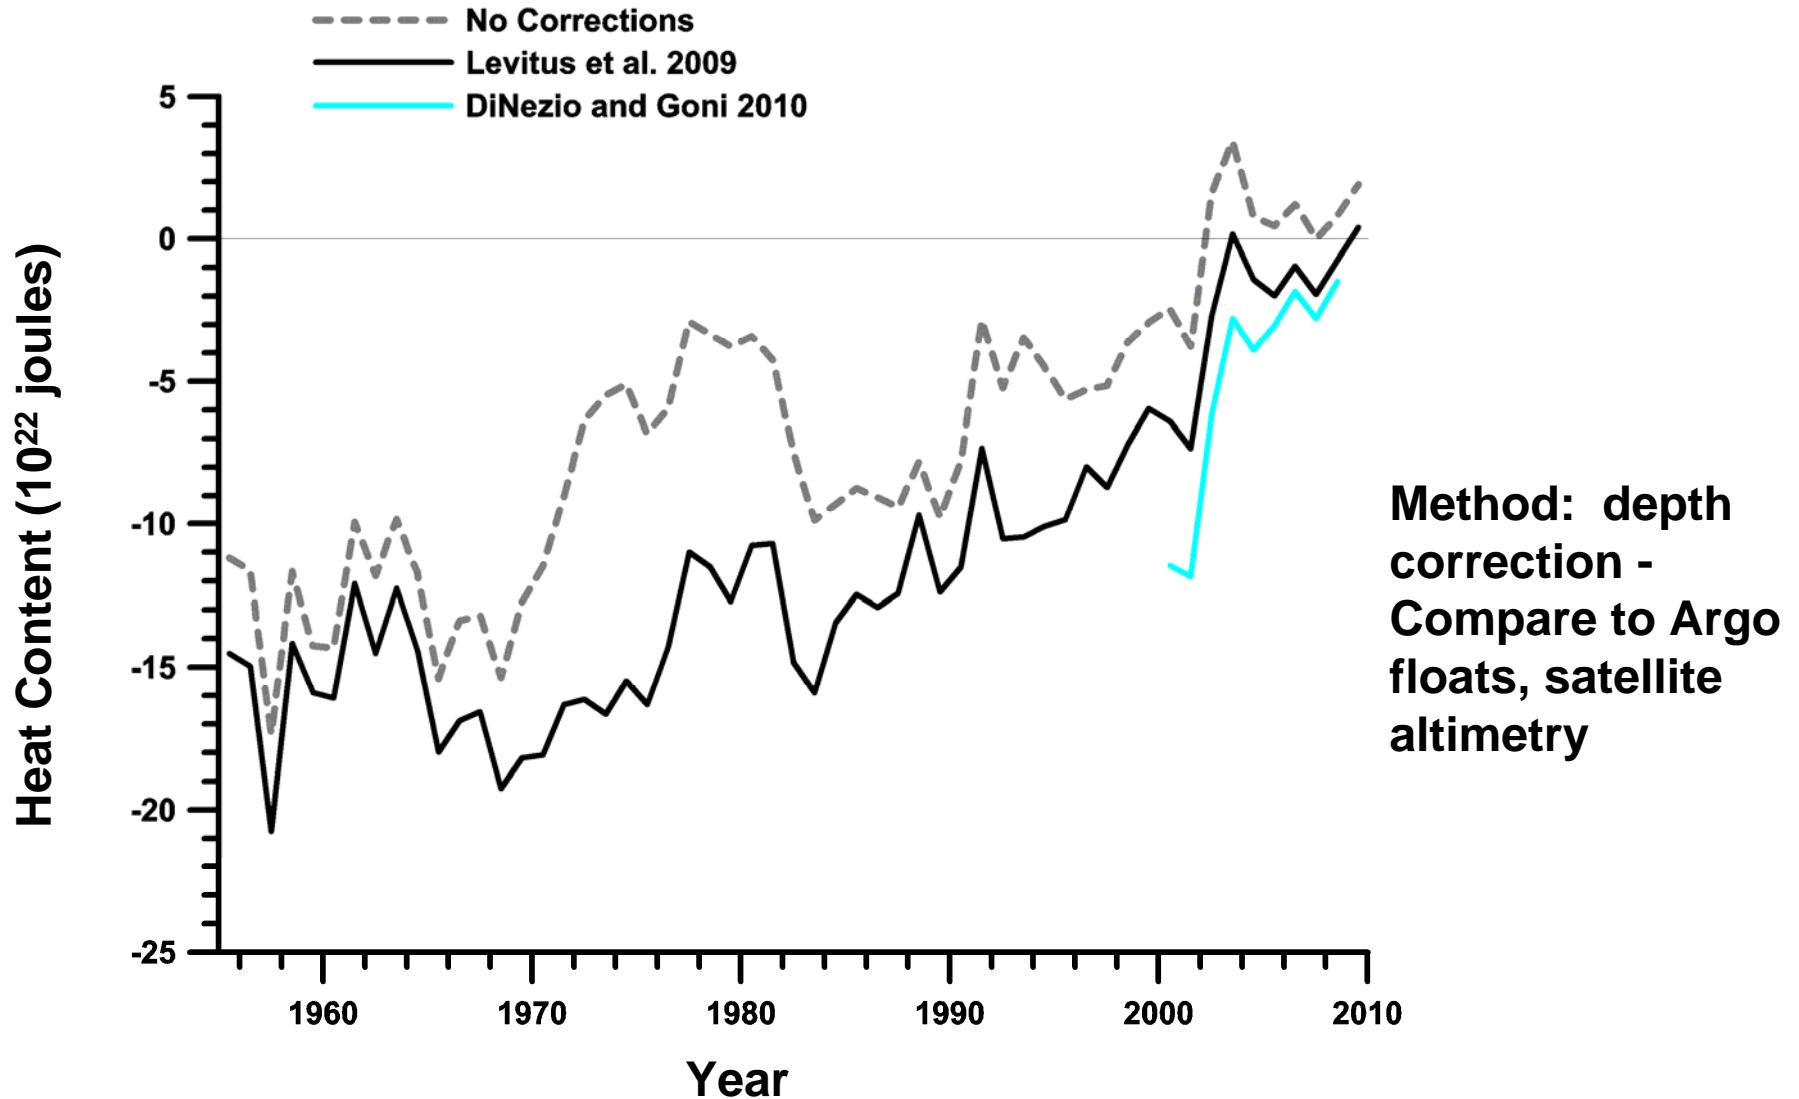

**No XBT Corrections**

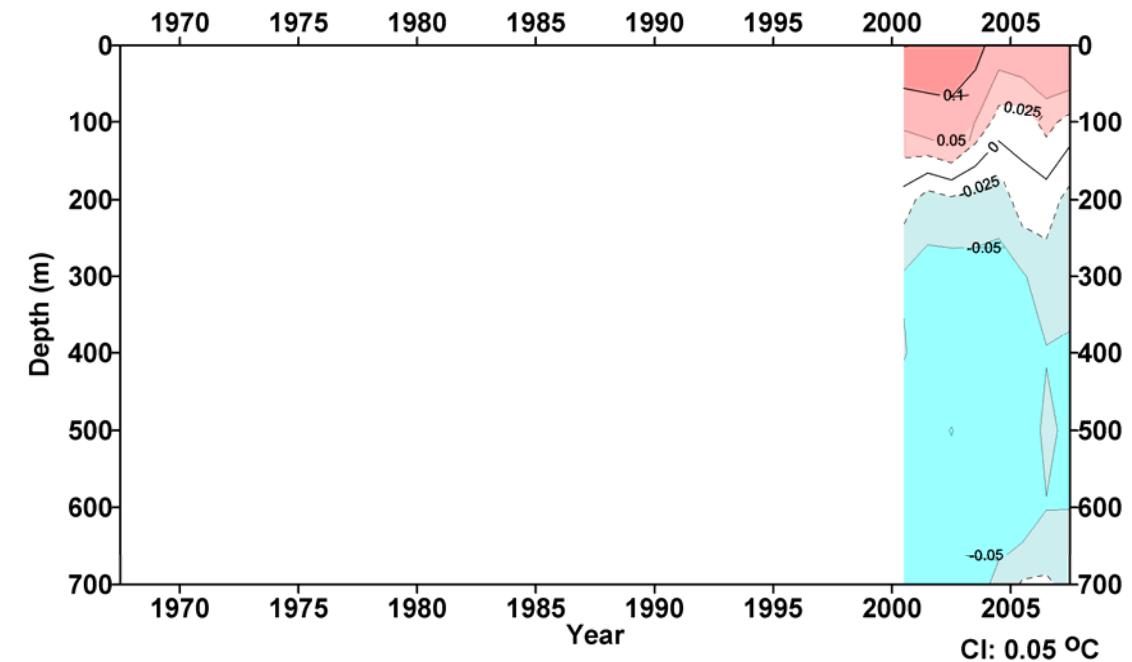

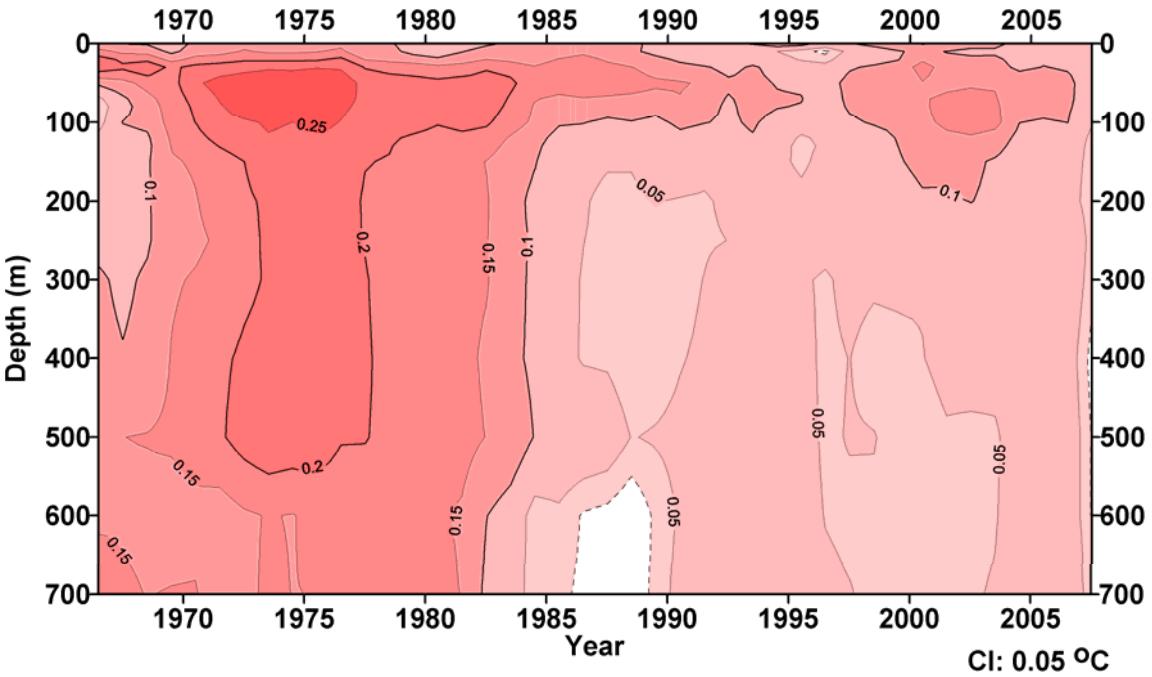

**XBT minus CTD  
temperature means**

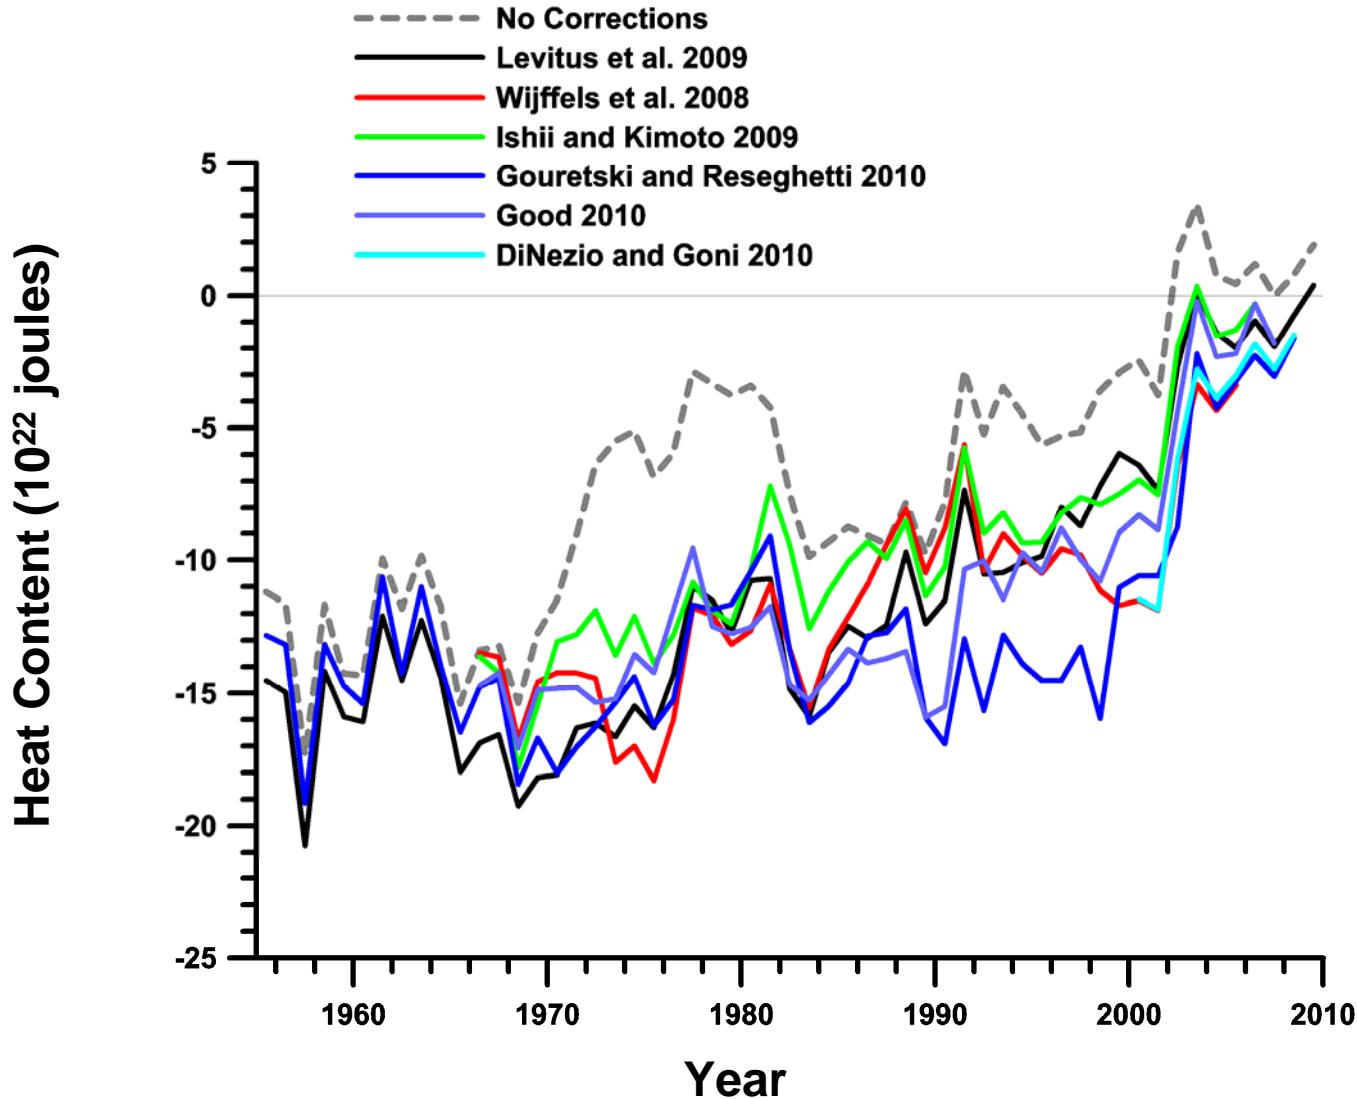

**Good, 2010  
corrections applied**

**Red=positive, Blue=Negative**

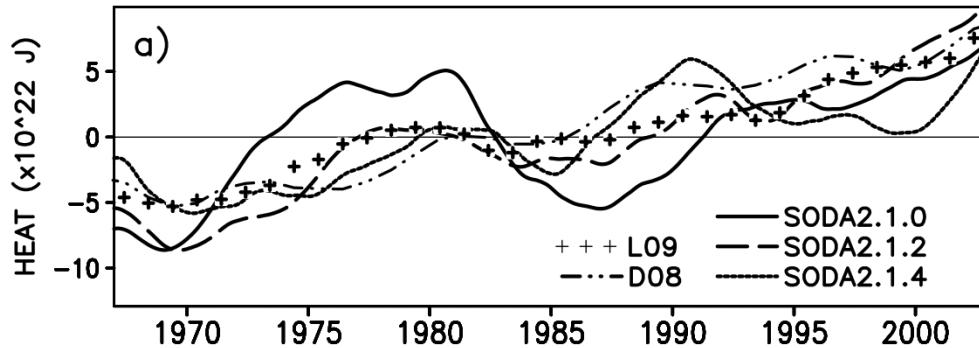

Integrated Ocean Heat Content Anomaly 0-700 m  
DiNezio and Goni, 2010 corrections

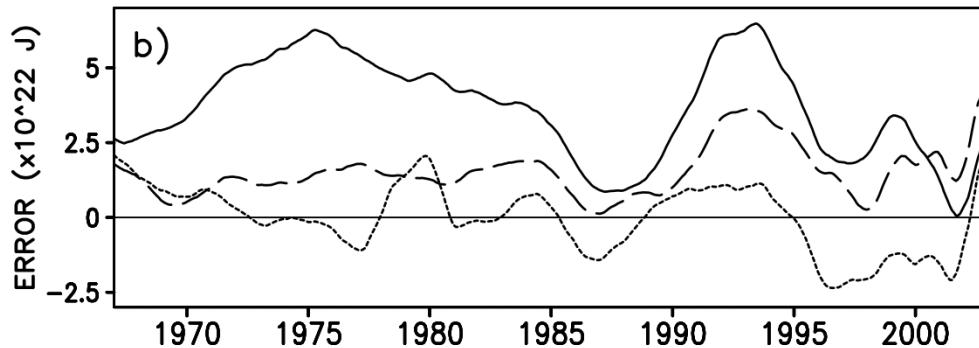

Integrated Ocean Heat Content Anomaly 0-700 m

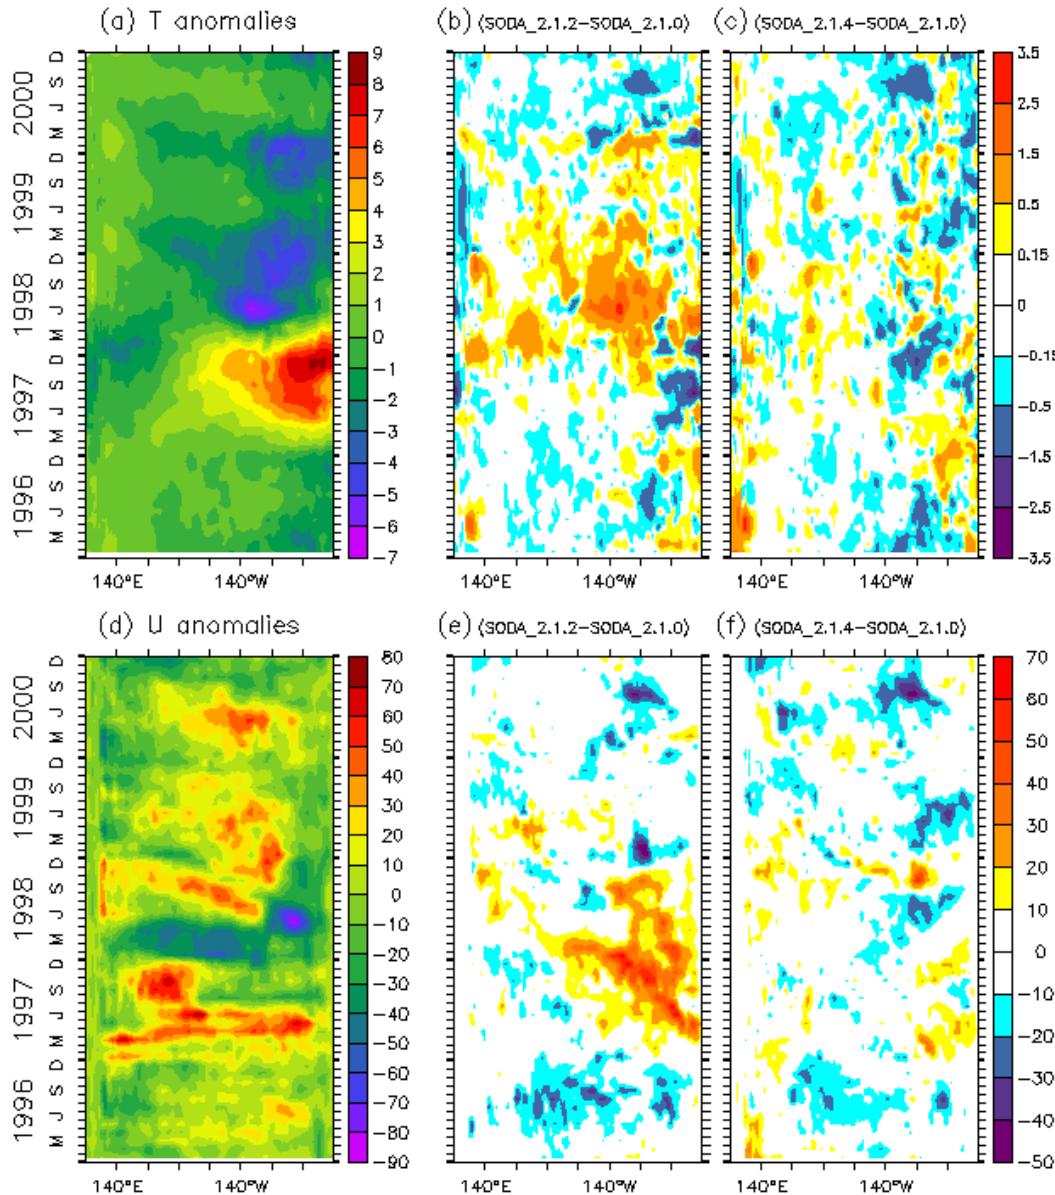

# How do XBT corrections affect assimilation models?

Examined in submitted Journal of Climate paper: “Impact of Bathymeterograph Temperature Bias Models on an Ocean Reanalysis”, Giese *et al.*

XBT corrections :Wijffels *et al.* (2008, W08) , Levitus *et al.* (2009, L09) significantly reduce errors in heat content in SODA model.

**Giese et al. continued:**

Instant impact of corrections  
can be large. 1997/98 El  
Niño/La Niña temperatures  
and currents changed  
significantly

rms error for current speed\*  
between ADCP and

Uncorrected run	<b>40.7 cms<sup>-2</sup></b>
L09 run	<b>30.8 cms<sup>-2</sup></b>
W08 run	<b>48.4 cms<sup>-2</sup></b>

\*5-day average zonal  
current at 50 m

# Conclusions

- Many XBT corrections, all improve heat content calculations over uncorrected data.
- Corrections are not consistent with each other, causing inconsistencies in heat content calculations.
- Not new conclusions (Lyman *et al.* 2010)

# **WHAT TO DO ABOUT IT?**

- **There is a need to decide on a recommended method for XBT correction.**
- **Cannot force researchers to use one method. However, researchers can be encouraged to present results (or alternate results as the case may be) using recommended corrections.**
- **Make XBT data readily available with corrections. Make sure these data are updated regularly as XBTs are added to global database**

# Criteria for Recommended XBT correction method

- Should be able to successfully meet a performance criteria: such as being able correct 95% of all depths to within 0.025°C vs. CTD in statistical tests.
- Should be relatively easy to implement, fully documented, extendable into future.
- Should cover all XBT types, all observation depths, all time periods.

### XBT Bias Depth and Temperature Corrections

For any questions about this page, please e-mail [OCLhelp](#) desk

Gouretski and Koltermann (2007) shows statistics from Expendable Bathymeterograph (XBT) vs. Conductivity-Temperature-Depth (CTD)/reversing thermometer instrument comparisons which reveal a warm bias in XBT temperatures. This bias varies over time and over depth. The bias may be due to both errors in the calculation of depth and in measurement of the temperature. An important deviation from the majority of existing correction schemes is that depth correction varies with depth.

A NOAA sponsored XBT Fall Rate Workshop was held in Miami, FL, March 10-12, 2008 to discuss this problem. Results of that meeting came to no conclusion as to the best way to correct the bias.

A second XBT Fall Rate Workshop\* will be held August 25-27, 2010 in Hamburg, Germany.

A number of papers with estimates of corrections have been published or submitted to scientific journals. The corrections proposed in some of these works are provided here to facilitate intercomparison by the scientific community. The corrections proposed by Gouretski and Koltermann (2007) are not included here, as they have been superceded by the corrections proposed by Gouretski and Reseghetti (2010).

Gouretski, V. V., and K. P. Koltermann, 2007, How much is the ocean really warming? *Geophysical Research Letters*, L01610, doi:10.1029/2006GL027834

Wijffels, S. E., J. Willis, C. M. Domingues, P. Barker, N.J. White, A. Gronell, K. Ridgway, J. A. Church, 2008, Changing Expendable Bathymeterograph Fall-rates and their Impact on Estimates of Thermosteric Sea Level Rise, *Journal of Climate*, in press. ## US NODC XBT Bias Page

Currently: contains various XBT corrections methods and tables. Can Continue in this capacity

Future: Can contain information on recommended method, corrected XBT dataset (independent of GTSPP, WOD) updated periodically (monthly?)

[http://www.nodc.noaa.gov/OC5/XBT\\_BIAS/xbt\\_bias.html](http://www.nodc.noaa.gov/OC5/XBT_BIAS/xbt_bias.html)

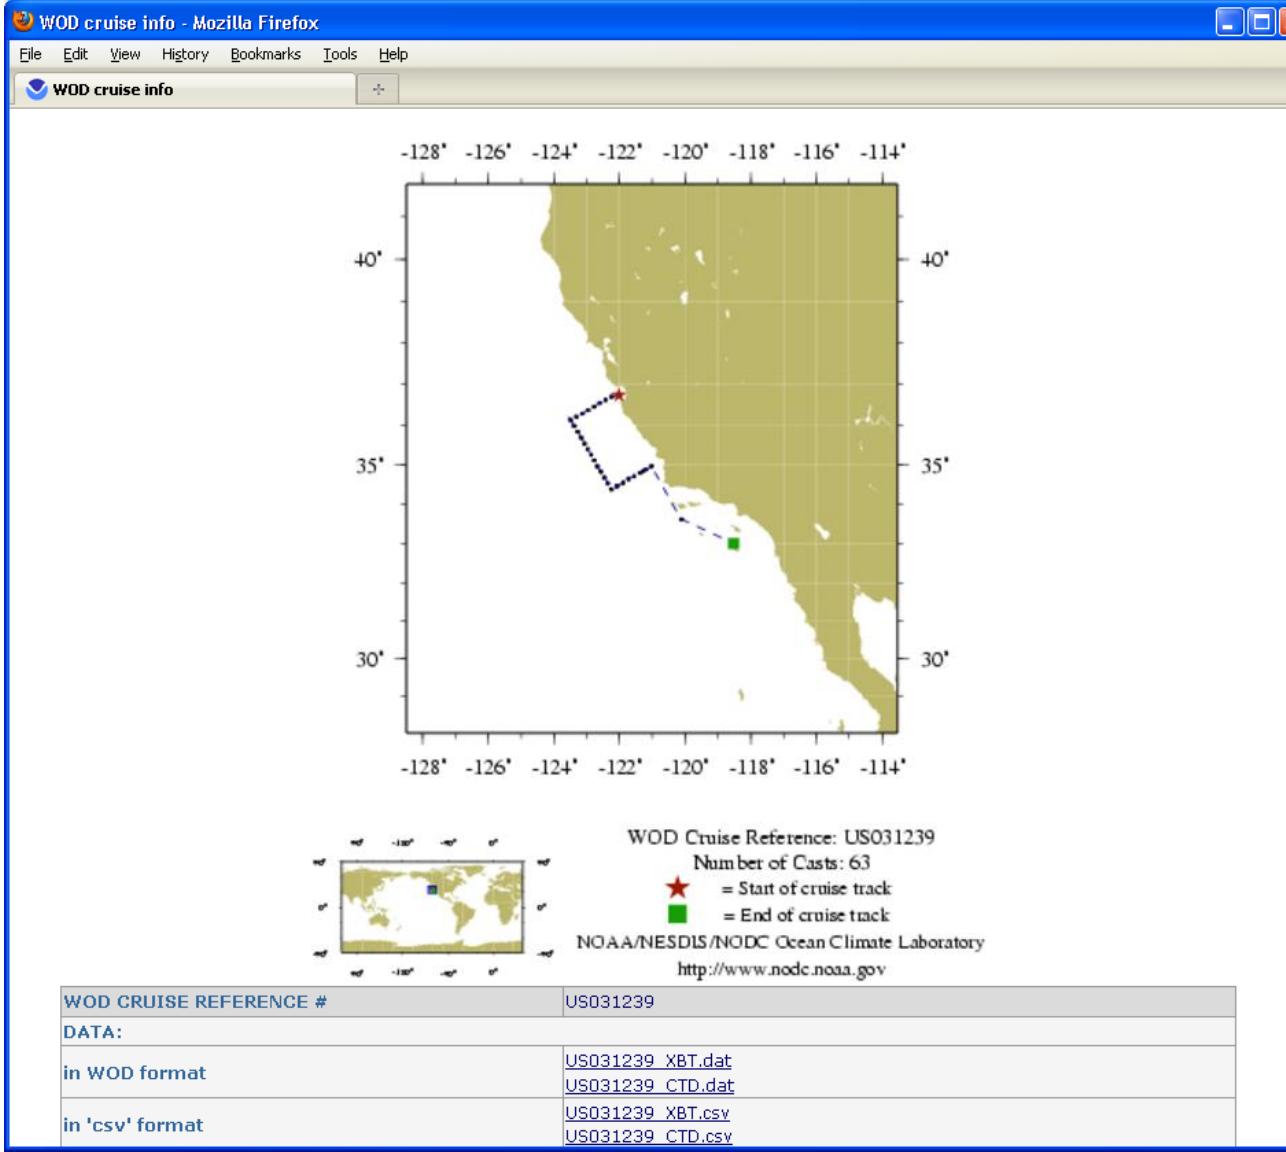

# NODC XBT Quality Tests Reference Table

- Deciding on one method does not mean the end to investigation
- XBT/CTD comparison test references and data can still be posted, downloaded.
- Very important to adjust recommended method (or change altogether) based on future knowledge.
- Nature of XBT correction, variability still changing.

The screenshot shows a Mozilla Firefox browser window displaying the 'XBT Bias References Page'. The page header includes the NOAA logo, the text 'NOAA NATIONAL OCEANOGRAPHIC DATA CENTER (NODC) UNITED STATES DEPARTMENT OF COMMERCE', and a 'NOAA Satellite and Information Service' link. Below the header, a breadcrumb navigation path reads 'You are here: NODC Home > Ocean Climate Laboratory > OCL Products > XBT Quality Tests References Table'. The main content is titled 'XBT Quality Tests References Table' with a '(more info ...)' link. A table lists six references, each with a Ref# (1-6), Author(s), Year Published, Title, Publication, Depth Equation, and Temperature columns. The table is scrollable, with a vertical scrollbar visible on the right side of the table area.
