Reported errors

Learn the error estimating technique and
apply it in the Southwest Atlantic

Data from Brazilian Data Center (BNDO)

Methods

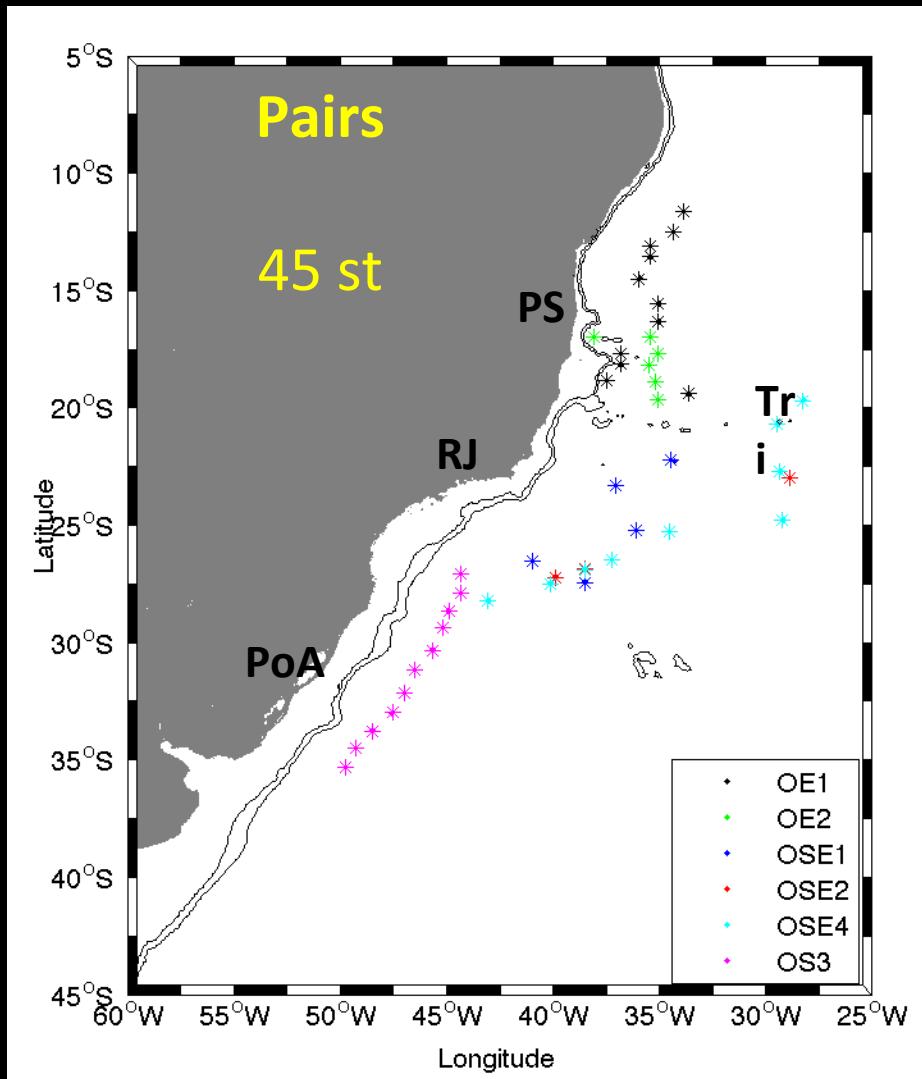

Based on:

Hanawa et al (1995)

Kizu et al (2005)

- Match criteria used
 - 0,2° of longitude and latitude
 - One day
- Data interpolated
 - Linear every meter (0 to 1000m)
- Filters
 - Median
 - Low pass

Data used:

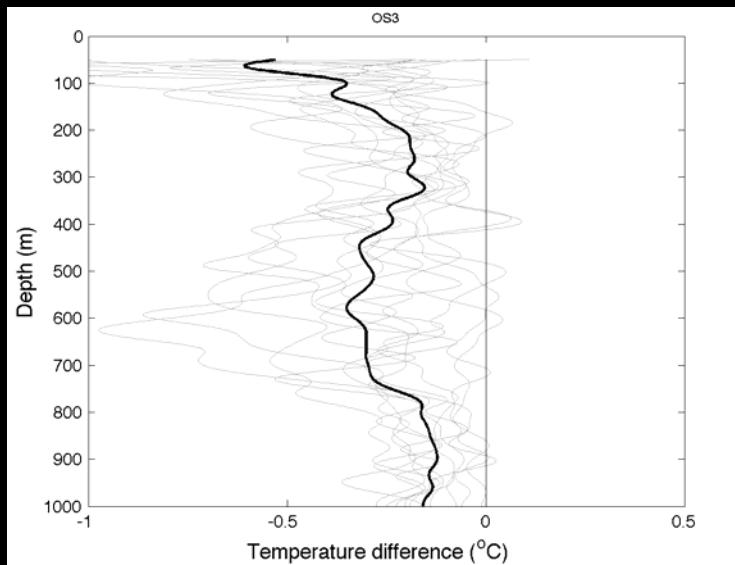

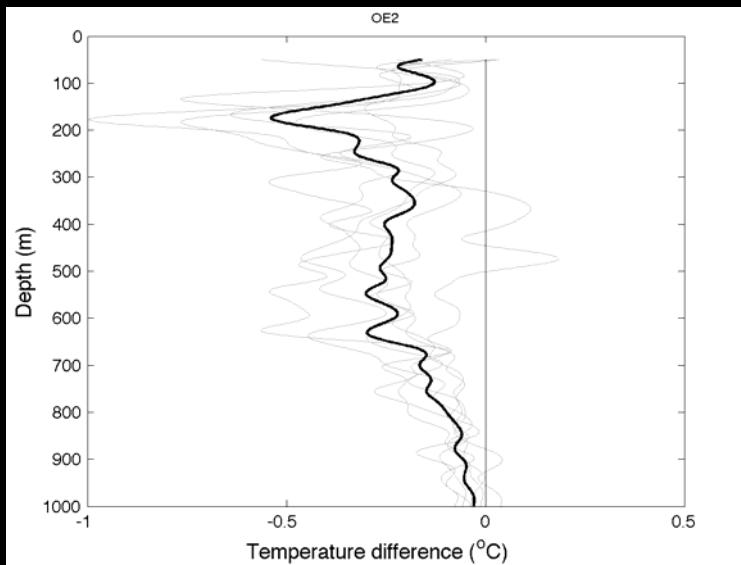

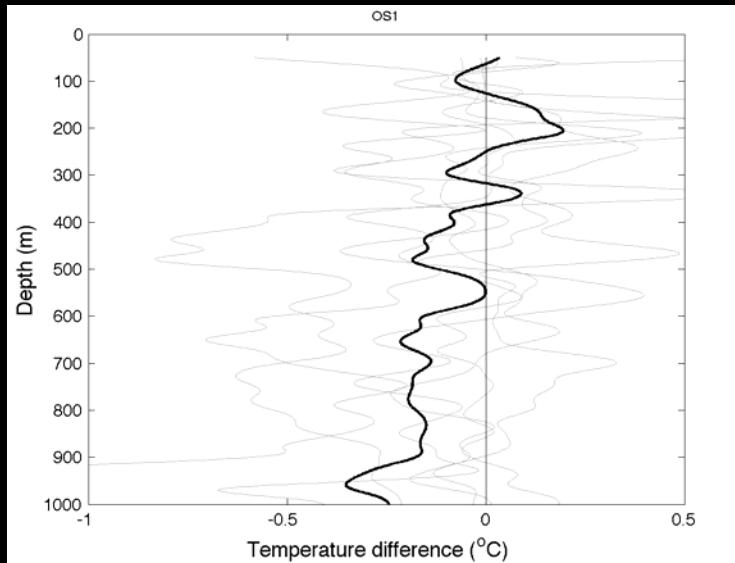

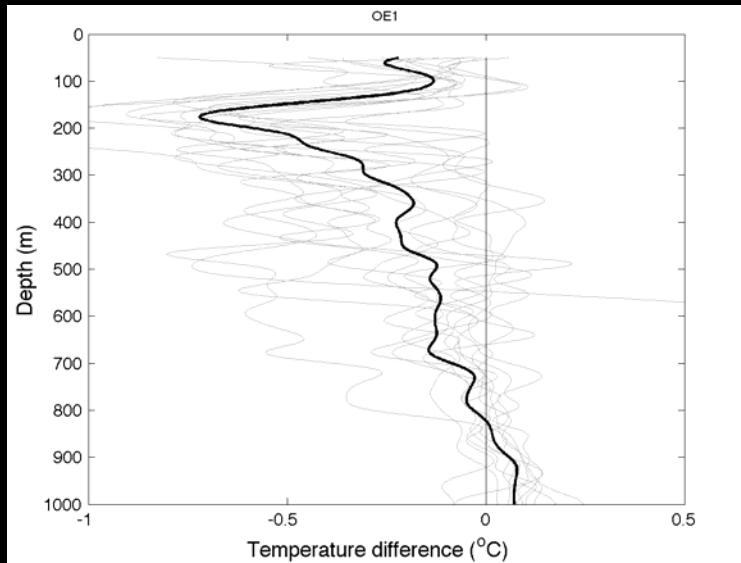

Methods

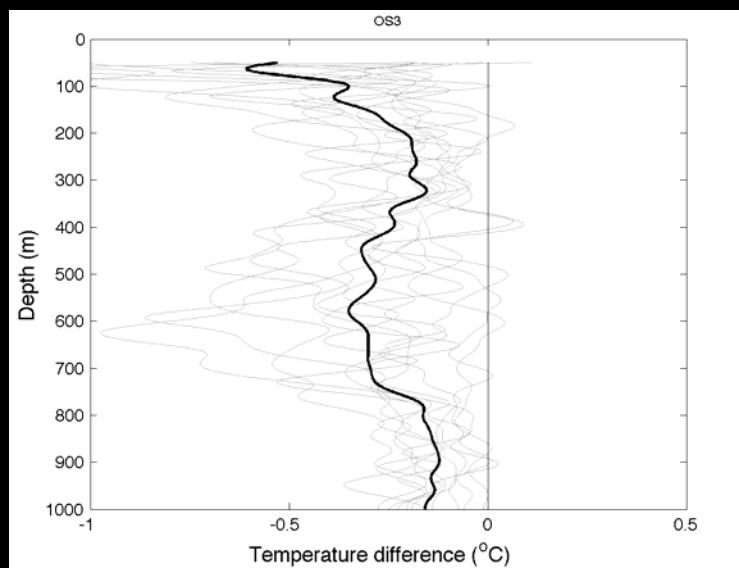

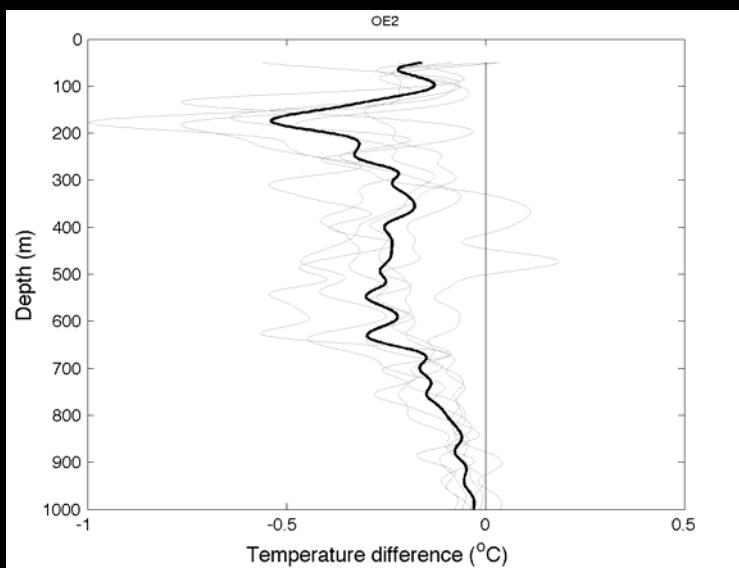

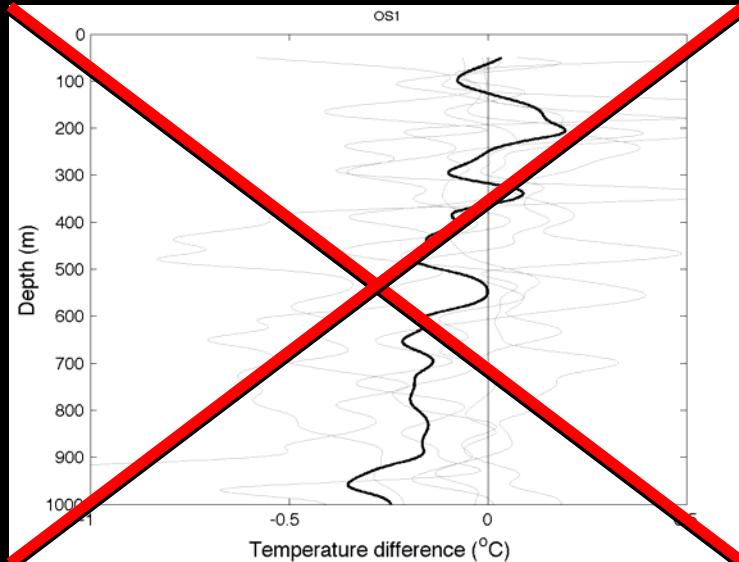

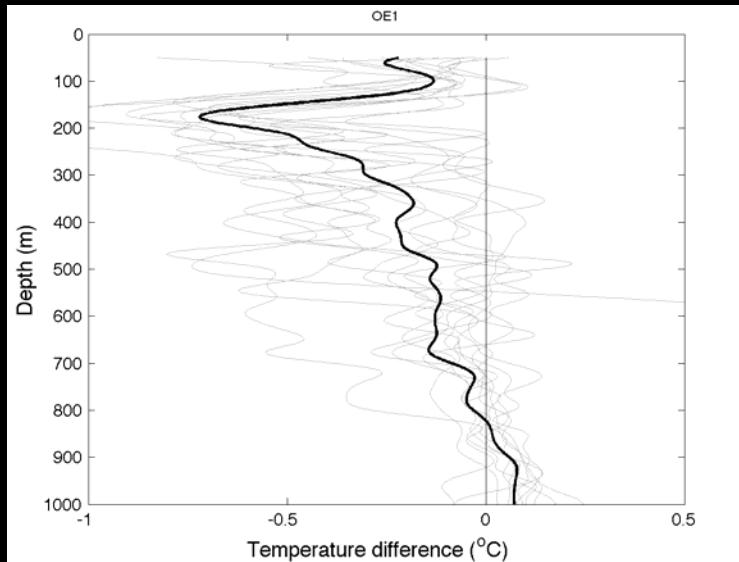

Based on:
Hanawa et al (1995)
Kizu et al (2005)

- Temperature gradient
 - From 50 to 1000m
 - Subsets every 50m, centered
- Corrections
 - New time depth association
- New fall rate
 - One for each pair
 - Mean of “a” and “b”

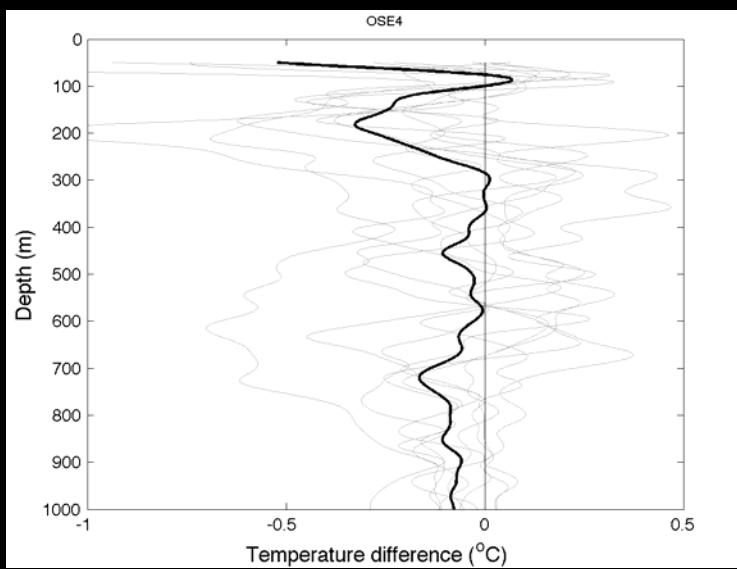

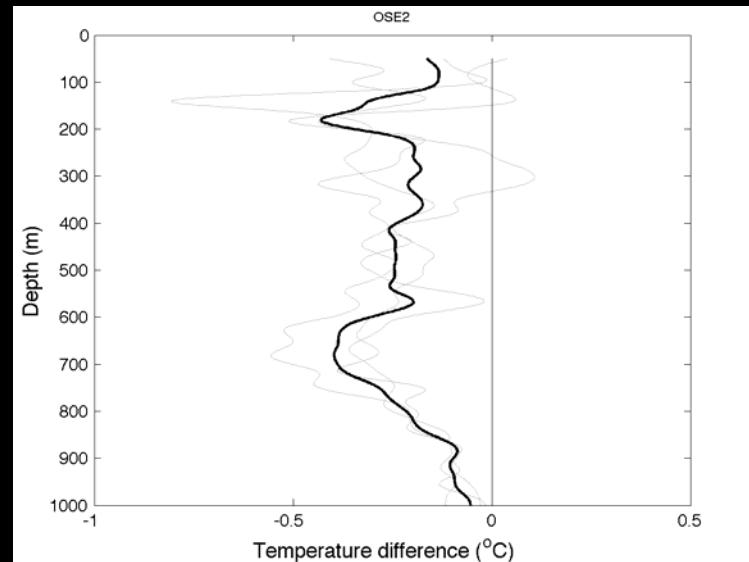

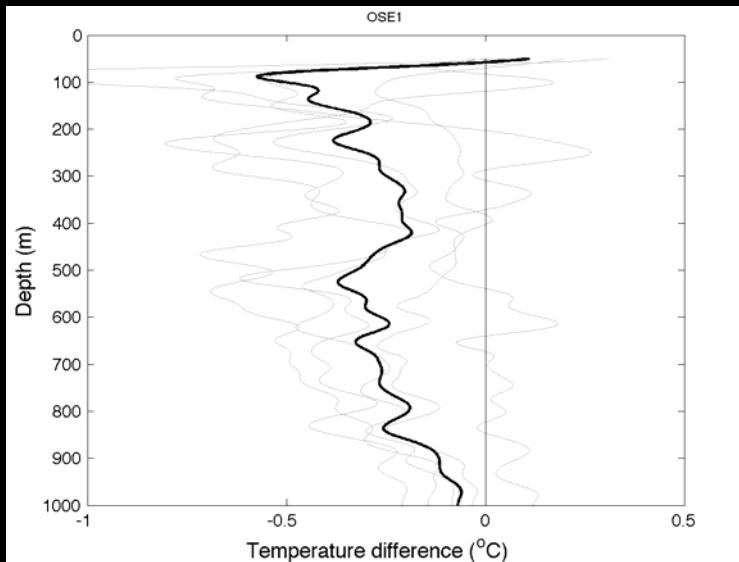

Results

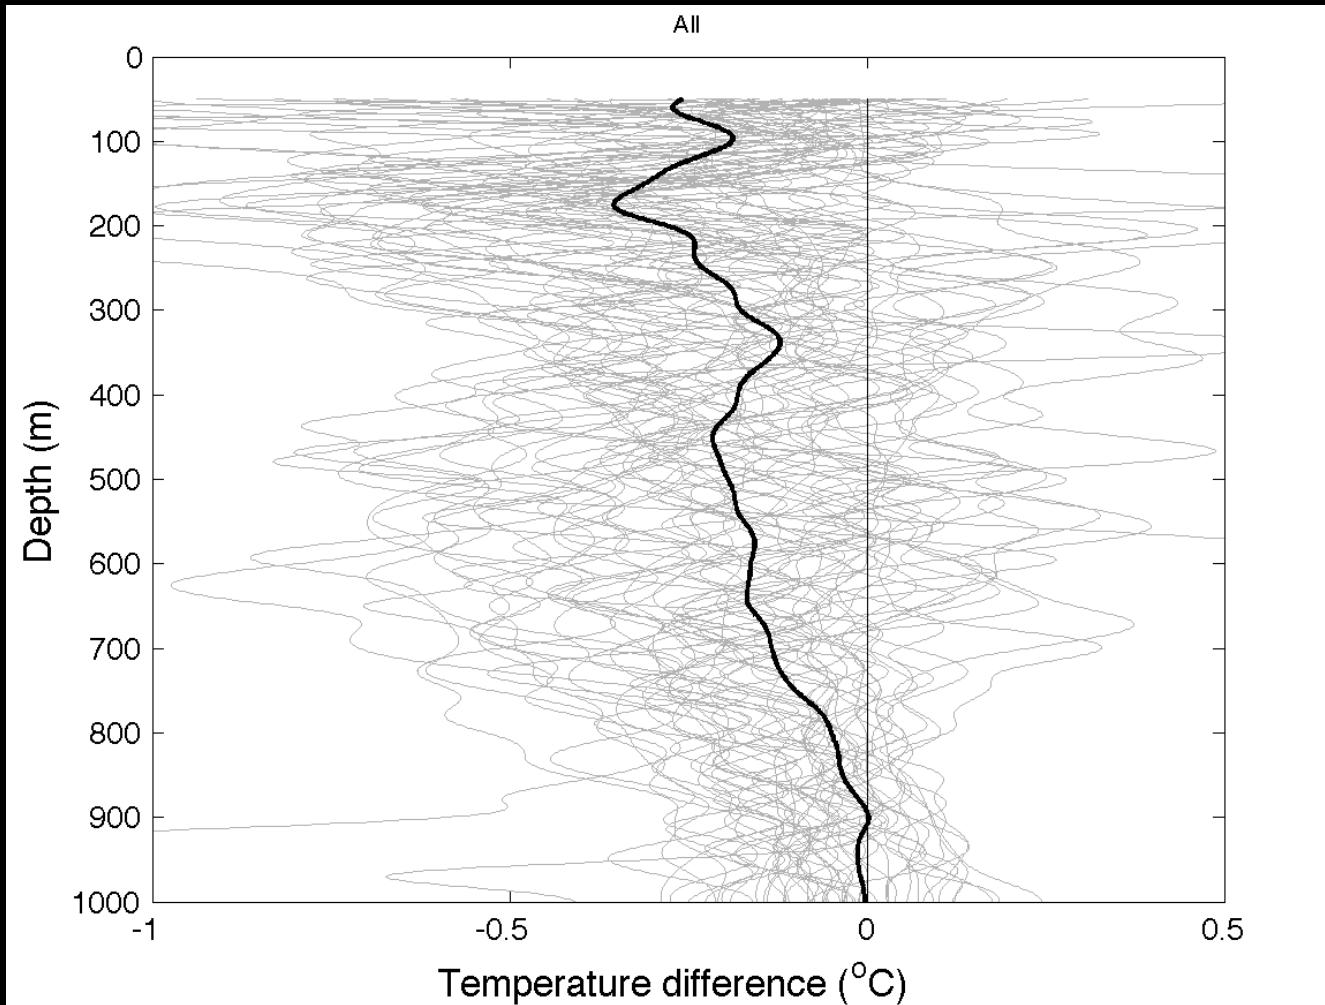

Results

Results

Results

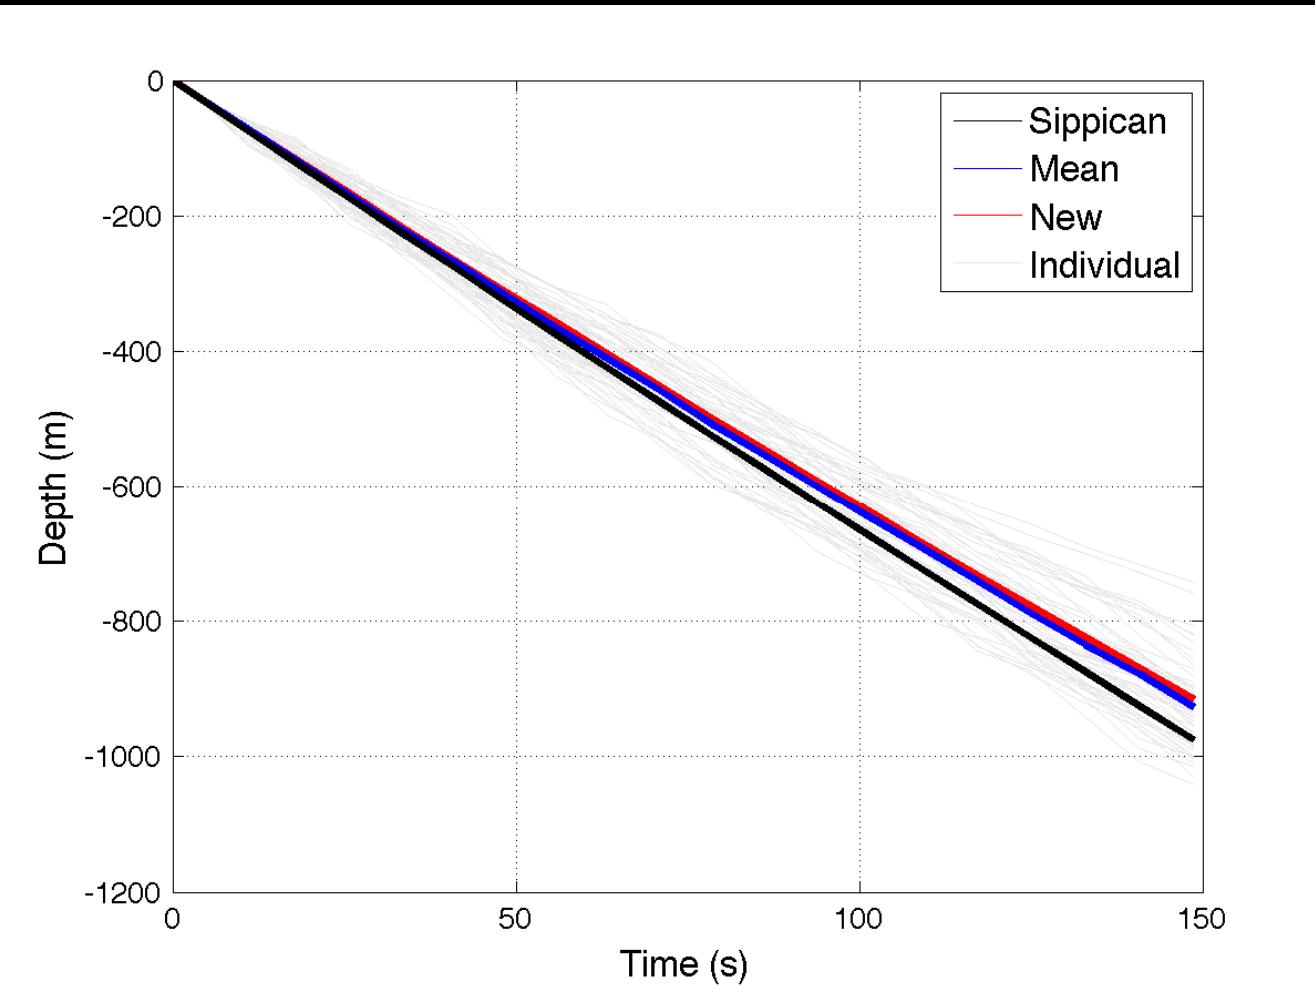

Results

- From the 45 pairs only 17 were used

Sippican : $Z(t) = 6.828*t - 0.00182*t^2$

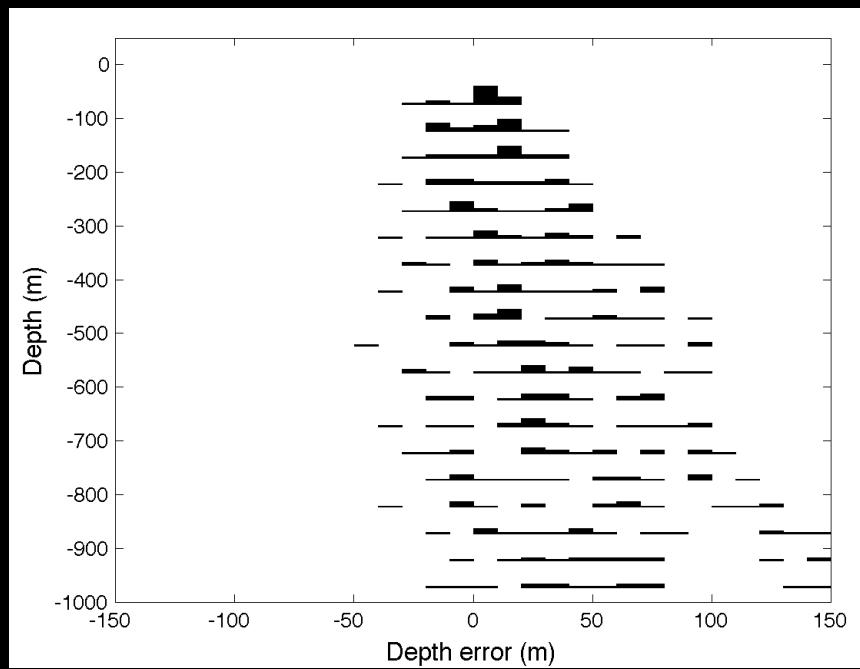

New : $Z(t) = 6.5328*t - 0.0028*t^2$

Conclusions

- Depth is overestimated by Sippican fall rate
- CTD and XBT temperature differences are higher around 200m,
- The new fall rate proposed reduced the RMSE from 38.09m to 19.70m ;
- MOVAR sections had larger temperature differences around 600m
- Volume and heat transport above 400m had only slight changes (< 10%)

For the future

- Search more matches for CTD and XBT casts;
- Verify possible errors for other XBT models;
- Try to get good comparison data below 1000m;
- Encourage simultaneous CTD and XBT casts

Thank you for the attention
